It's a sad comment on the state of this newsgroup that an objective
statement of what are believed to be facts is taken as "throwing [the
engineer] into the lions' den". It's not my intent at all to impugn the
engineer. Surely he's aware of the efficiency of the "antennas" he's
creating, so either my (and Frank's) calculations are grossly incorrect
or SPAWAR thinks there's a market for such inefficient antennas. It
would be educational to know which of these is the case. It was
interesting that there was no mention in the video of very low
efficiency, but I guess that's to be expected for a promotional piece
produced by a marketing department looking for investors.

Roy Lewallen, W7EL

The point I caught, and apparently was not modeled, was the discussion of antenna height for any particular band. Albeit, such mention was fleeting, but it sounded suspiciously like half wave, not quarter wave dimensions.

Aside from that speculation, power specs for military usage are appropriate for theater operations, not global communications. When I taught UHF/VHF in the Navy, 10% efficiency was considered perfectly acceptable as point-to-point communications was the only expectation and that was rarely as much as 20 miles at best. Experience teaches that even that only takes 100s of milliwatts.

That's still an order of magnitude better than what this antenna seems able to do at VHF, although the demonstration clearly showed it to be adequate for working a local repeater with an HT.

But what about HF, which the video clearly mentions? Is a fraction of a percent efficiency adequate for typical communication needs? I know that some military HF use is NVIS, for which a vertical antenna is poorly suited to begin with, so that probably wouldn't be an application. Are milliwatts of radiated HF used and useful for theater communications?

Hawking radiation seems to be caused by the quantum soup complementary
virtual particles that wink in and out of existence in space. Instead
of being spontaneously annihilated, one of the complementary virtual
particles falls into the black hole and one escapes thus becoming a
real particle.

What about if you are a whale?

What if you are a firefighter?, you can got a good 160 m portable
antenna in your fire engine! Do you remember the pretty nice
"Frequency" film with Dennis Quaid as W2QYV, an ideal antenna for
him :>D

Tomorrow, it is going to be all over the net, "Cecil says every time God winks a particle of light falls into a black hole; And a new one is born!"

Regards,
JS

ROFLOL! Good sense of humor man!

And, you are totally correct, firemen expending BIG tax dollars for a
dollar conversation is about right.

Regards,
JS

Hello boys, good day for you

Is it Carolina Windom a balanced load to justify the name "balun"? We
could think in a device to transform Z and another device to block
feed line current. What do you think about it?

Miguel

Yes, I see your point, and agree. I have never ran a windom or experimented with it, so obviously, others are much more knowledgeable with them. However, logic tells me they would be one easily justifiable situation to use a voltage balun ... the CM currents being looked at separately ... the balun must have a definite and pronounced effect on pattern with this particular antenna.

Please note: As ignorance is slowly alleviated (over the centuries)
that option slowly disappears. Did you see this?

No. I turned the "truth" into a "joke". The same as others did with my
antenna design where they turned it into a massive joke so that they
could apply judgement with a lazer for laughs and nothing being meant
to hurt me as a person.
Lets move on

Let me look around a bit ... hmm, well, ignorance seems to be bliss, and in vogue! Public servants have even made it stylish! ROFLOL

Art, just before you move on too far, note that 'laser' and 'taser' are
actually spelt with 'esses' - even in the USA!

we don't have to turn your design into a joke, it starts that way and
you try to pretend its the truth.

Seriously, though, the real question is "Where did the ether come from?" (and, everything else which is composed of it.) You can see how far we are from even being able to pose that question; We have to "discover it" first. It is actually a little premature to be having intelligent conversations, debates, discussions, etc. until there is something to have them about!

Regards,

JS

Excellent article. States my premise well, especially:

"Because there is a law such as gravity, the universe can and will
create itself from nothing," the professor said in his new book, in a
challenge to traditional religious beliefs.

I am aware of no such proofs of such a law; And, Hawkings only presents
another religion for us to join-- "The Order of the Law of Spontaneous
Creation."

Don't need more religions, need answers here. Don't need to convert
science to a "football game" where you choose your side and root for it
... Hawkings proposes I make a leap of faith not even I can stomach ...

Regards,
JS

Unfortunately, reports of such incidents are eminently believable. In
the UK, the police are as trigger-happy as in the USA. They twice
tasered one guy sitting in a bus, because he failed to respond to them.

Ian,

I am not making light of the reality of bad judgment, and the seeming
explosion of it recently.  These situations and the efforts being
applied by our public servants, from the president on down, I follow
closely ... frequently in utter amazement.

I am just having a bit of fun, as I am sure you were and even Art is, in
his own way.

Regards,
JS

John. Some are looking for an explanation for the existance of the
horizontal vector between two mediums. I do not know the originality
of that particular finding. I do know that a horizontal vector exists
in radio ie surface wave. Naturally some scientists would want to know
the other medium that allows this to happen and others have not
provided an explanation, so there is scientific reasoning on both
sides
Now Art came along and expanded Gaussian static law to make it dynamic
and equal to Maxwells equations on radiation. Thus was established the
presence of galactic particles resting on all diamagnetic surfaces on
earth, bearing in mind that diamagnetic material composes 99% as well
as the mantle of Earth of Earth ( Bismuth). Now that I have described
the other "medium" in question I will leave it to scientists to
determine and understand the questions arising from the double slit
experiment
which in these days of denial may take another 100 years. Remember,
the presence of particles is well established outside classical
physics and partical physics and now we can all agree that what can be
accellerated must consist of mass.
This thus dismisses the silliness of radiation being created by a wave
which is only an adjective decribing the movement of same in
abundance.
Like the "o" ring in the space vehicle scientists deride what
engineers accept as normal.

Apparently, human intelligence and logic has not yet evolved to be able to handle such questions although Ayn Rand came close decades ago.

John, since you asked that question about what caused the ether, you obviously must believe in the principle of "first cause", i.e. everything has to have a cause. To avoid being a hypocrite, you must also asked yourself, "What caused God?" - and what caused the cause of God? - and what caused the cause of the cause of God? ... ad infinitum.

I suspect Hawking is thinking: If everything has to have a cause, what
caused God? And if God doesn't need to have a cause, then why does the
cause of the Big Bang need to have a cause?

Yes, yes I do see cause and effect--in everything which is real ... indeed, if someone comes up with an amazing story which leaves one out, cause or effect, I am highly suspicious. And, which I am of God, which, obviously, must exist!

As I have stated, I see nothing ordered, which is highly complex, unless a thinking mind has created it. When someone says, "Well, here, here is that "something" which breaks all the rules and it "just happened by accident" or it "just is, has been and always will be", I think, "They/he/she has to be kidding", even if Hawkings advances it. And, yes, logic dictates there must be one thing which did get "the ball rolling." That is God, whatever God is? If you want to make the ether God, well, great, let's explore that possibility. However, all anyone does is pose the "circular logic" which brings yours/mine/everyones mind back to the beginning and you must ask, "What is the God." Or, "What is the God event", etc.

It is un-win-able ... I suspect, better minds than Hawkings has pondered it down though the millennias.

Regards,
JS

But do you appreciate the first cause contradiction? What caused the first cause? e.g., what caused God?

I had an epiphany today. I realized why God is missing in action so much of the time. The Bible says that 1000 years in the life of God is like a day in the life of man. Man sleeps 1/3 of ever day. So God must sleep for 333 years out of every 1000 years. Bad things happen during the 333 years that God is asleep. Witness the present.

Well, first of all, I don't insist the bible be taken literally ... I do accept, that parts, i.e., Genesis for example, which happened before man could create written records. These stories had to be passed father to son, mother to daughter, etc. until mans ability to record these stories on non-verbal media came into existence. And, God sleeping? Naaa ...

Your first point points out why Hawkings seems to be "losing it," to me. He thinks everything began with the big bang ... the beginning was before then, it was when the ether came into existence, immediately raising the question, "Who/what created the ether?" And, perhaps the creator of the ether has a creator ... so, this is why I think we need to know more about the ether ... like I suggested, why even begin "making guesses" until you have enough data to make them intelligently? And, I over-emphasize that, of course, we may guess, but we need to remain honest and admit they are only ballpark guess on only the limited knowledge we now possess. Unfortunately, as you see, a guess can quickly become a religious order ...

So, to summarize, Hawkings is two steps ahead of creation (and God) already, he ignores, "Who created the ether?" and "Who created the ethers' creator?"

Regards,
JS

Yes, very clever. When you only have a tazer at hand it probably is a good choice. Over here one finds special-purpose electroshock devices in many public places, and police officers often carry one in their car, but not on their belt. So he must have figured the tazer was better than nothing in this case.

"Before the Big Bang" is an oxymoron. Our present big bang originated from a mass/energy plasma singularity. There was no ether in our universe before the big bang. There was no space in our universe before the big bang. There was no time in our universe before the big bang. There were no particles or EM waves in our universe before the big bang. Our present universe did not exist before the big bang. Consider that our universe may have originated from a black hole that exploded as it reached some critical mass/energy threshold and detached itself from a parallel parent universe as it winked out of existence in the parent universe. I use the geometric term, "parallel", rather loosely simply to indicate that the multiple universes never touch after the separation.

Always were the two ethers. Normal for the normal electric waves and the
"special" for the EM waves.

The normal is that by Ludwig Lorenz and the second by H. Lorentz.

The normal is the rare plazma (electrons, ions, atoms and dust).
The special is in many forms.

The normal is produced by the Sun. The special - I do not know.

Here we differ, I think the ether existed long before the "big bang" (indeed, it could be the was, is and has always been in God.) Whatever the big bang was, all it did was rip our observable matter, into an altered state, from the fabric of the ether itself, and we look back and record "the beginning" from that event.

>> There was no time in our universe before the big
> bang. There were no particles or EM waves in our universe before the
> big bang.

That statement is right on one account, there was not "time" in our universe ... but then, there still isn't. There is only movement ... I do believe the ether is composed of some type of particles, and I do believe the ether accounts for the transmission of our EM waves ... so I imagine that some type of "disturbances" were occurring in the ether, even before the big bang ... but, proofs, or disproofs, lie in the future ... I would drop everything and work to prove, or disprove, the ether ...

'normally' when something has to be called 'special' it means that it doesn't represent the real world... not 'special' relativity is just a subset of 'general' relativity. if the 'normal' is created by the sun and we now know that there is a discontinuity at the edge of the solar system where our solar wind is deflected by the galactic plasma... and indeed there are major discontinuities around the earth due to our magnetic field... why are there not distortions in the waves traveling in the plasma? if waves travel in water and the water is moving the waves move with the water, why can we not measure the difference in speed or direction of waves carried in the moving solar plasma, especially when it moves around planets with magnetic fields? why are light waves not affected by magnetic or electric fields??

subset of 'general' relativity. if the 'normal' is created by the sun
and we now know that there is a discontinuity at the edge of the solar
system where our solar wind is deflected by the galactic plasma... and
indeed there are major discontinuities around the earth due to our
magnetic field... why are there not distortions in the waves traveling
in the plasma?

All is like with the sound waves in the wind.

> if waves travel in water and the water is moving the
waves move with the water, why can we not measure the difference in
speed or direction of waves carried in the moving solar plasma,

We do: "
"1925 - the Michelson-Gale-Pearson experiment produces a positive result
while attempting to detect the effect of Earth's rotation on the velocity of
light. The significance of the experiment remains debated to this day, but

this planetary Sagnac effect is measured by ring laser gyros and taken into account by the GPS system."

>especially when it moves around planets with magnetic fields? why are light waves not affected by magnetic or electric fields??

They are. Faraday effect, electrooptic effect and so on.
S*

Light waves (electromagnetic fields) are photons. Magnetic and
electric fields are also photons. Photons do not affect each other
unless they are coherent in which case interference can take place.
Photons have no rest mass and no charge. Any number of photons can
occupy the same "space". Photons are affected by the curvature of
space through which they travel.

In deep space, light should go 100% unimpeded by any magnetic fields.
In an atmosphere, plasma, or other media, I would think light can be
affected, fiber optics can even bend light using a physical force acting
on the media carrying the light, instead of a magnetic field.

In deep space, there is almost nothing but ether, and ether, the
gravitational ether of Einstein, needs to be bent with gravity, and when
the ether is bent, some distortion of the path of light should certainly
be detected ... but that debated experiment, someone already mentioned,
carries on.

Regards,
JS

It is getting close to winter times when decisions have to be made
for the seasonal antenna. My antenna is frequency independent with a
cavity / reflector and I have been feeding it via coax direct ie
unbalanced because of the constant impedance, therefore unbalanced to
balanced should not be a problem.
Anybody see an error in thinking here.
The antenna will be on a tower as the antenna picks up all
transmission modes so I need to get away from ground noise. I will be
adding an elevation changer if I have the time other wise it will be
parallel to ground or zero elevation.
Many thanks for your inputs
Art

No deep space. Everywhere is the Interstellar Medium. There happens the
interesting things with the light.:

In "deep space" are also stars so the electroms, ions, atoms and dust have
the different temperatures and density. Speed of all waves are the
temperature dependent. The refraction index also.

Hello John,

For me this is just a  Guanella balun, 1:4 impedance transformation
with common mode suppression. I didn't do the math to see whether
common mode impedance is sufficient for OCF dipoles (to avoid feed
line radiation).

Regarding color use (purple/pink), that isn't limited to California
only.

Best regards,

Wim

At this point, I can't even remember why the reference of "balun to windom to Cecil" holds a relationship in my mind ... I didn't pay any attention to the core material/turns/etc. of the baluns which I posted either ... just seeing if it related to what has stuck in my mind and tossed it at Cecil to see.

> Regarding color use (purple/pink), that isn't limited to California

I had wondered about that! P*ssed me off when I had to give up wearing purple ... I had always let the wife "wear the pink" in the family. lol

The one I remember was about the Carolina Windom 4:1 voltage balun at
the feedpoint and the 1:1 choke-isolator 20' down the coax. The
original Windom was fed, Marconi style, against ground.

of course, but this was not detecting aether movement, it was
detecting acceleration from the rotation of the earth as predicted by
special relativity.

those effect require a material that is sensitive to the field. it is
not the fields themselves that are interacting it is the fields and
the materials.

Uhhh, sorry to pose this question to you here but, doesn't a "tuner"
really just "shorten" and "lengthen" the feed line? I mean, not

physically, of course. But, it would seem to me that, this is exactly
what my xmitter and ant are "seeing."

Regards,
JS

> what my xmitter and ant are "seeing."

If all the tuner did was shorten and lengthen the feedline, there would be only one purely resistive low resistance available on the SWR circle on the Smith Chart and it wouldn't be exactly 50 ohms. So a tuner does one other thing - it transforms the non-50 ohm resistive impedance to a 50 ohm resistive impedance. It is not only the equivalent of shortening and lengthening the transmission line but also performs an N:1 transformer function. Of course, it does that seamlessly, i.e. it is not actually a two-step process.

When I vary the length of my ladder-line to obtain system resonance, I have to be satisfied with purely resistive impedances between 35 ohms and 85 ohms. I cannot achieve a perfect 50 ohms on all HF bands with my matching method. That would require the addition of an actual N:1 transformer which is certainly possible but probably not worth the effort. Since 35-85 ohms is perfectly acceptable to my SC-500 amp, I don't need a high-power tuner. And since the SC-500 is spec'ed to handle an SWR of 6:1, I doubt that an 35-85 ohm load makes it "unhappy". If my SC-500 has ever been "unhappy", I failed to observe that "unhappiness" but maybe I am just oblivious to such? :)

Hi Mike,

High temperature is a relative thing (being it is measured in the 10s of Kelvins for high temperature superconductivity).

However, Impedance? In the convetional application here in this forum, it is a remote consideration for research. Afterall, nothing has changed about the usual characterisitics of conduction, inductance, or capacitance except for conduction's magnitude/density.

Aside from the conventional discussion here, researchers do tons of work in the realm of superconductivity that employs radiation. That body of research is called Plasmonics and Excitonics. Phononics doesn't strictly apply because it is, by definition, high temperature.

Most of the research into subresonant structures is done in the nanoscale. What is discussed here as possibilities in that same regard is sheer nonsense. However, there have been glimmers of nanoscale research reaching out into the macro dimension.

I've posted such items from Boeing's skunk works on negative refractive index material research. It is something that could be modeled in NEC - but only at a vastly expansive scale with hours of computer time to run.

I am going to broach a taboo and see if an attachment of a split-ring resonator would be supported.

The SWR on a feeder will always be greatest at the load end. However,
because of the feeder losses, the power will also be lowest at the load
end.

So, although the power loss per unit length (in dB) due to SWR will
steadily increase as you approach the load end, because of the feeder
loss, there will be less absolute power (in watts) to lose as you
approach the load end.

The question is, at which end of the feeder is the most absolute power
lost per unit length?

> It ain't easy being human ...

Yep, conceptually knowing that one is going to die was so hard on our
ancestors that they had to invent the concept of an immortal soul with
an after-life, which is denied to our primate cousins who share 98% of
our DNA but don't know that they are going to die. My take is that it
is better to have lived and died (loved and lost) than never to have
lived (loved) at all.

Reminds me of the song, "Midnight Choir", by the Gatlin Brothers:

Will they have Mogen David in Heaven?
Dear Lord, we'd all like to know,
Will they have Mogen Davin in Heaven, sweet Jesus?
If they don't, who the hell wants to go?

I already explained that. On HF, maximum losses depend upon where the
current/voltage-nodes/loops are located on the transmission line. One
cannot answer the above question without knowing that information and
the answer is different depending upon the conditions.

Owen has previously proved that on HF, a higher SWR can result in
lower losses than a flat line when that high SWR is near a current
node and the feedline is less than a quarter wavelength long simply
because the average standing-wave current is *lower* than the flat
line current.

Ah, I see what you mean. I was thinking in terms of an 'electrically
long' feeder (many wavelengths long).
```

I can see that, for a 'short' feeder (for example, if you were feeding a halfwave dipole via a quarterwave of 300 ohm line), at the antenna feedpoint you will have a current node (high I^2*R loss), and at the TX/tuner end, where there is a voltage node, you will have a low I^2*R loss. It could be that the loss of a matched relatively low-impedance feeder of 50 or 75 ohms (being inherently higher than that of higher impedance feeders with similar conductors etc) could be higher than the average loss of the 300 ohm - even though the antenna will present an SWR to the feeder of around 4 or 6 to 1.

That still leaves the question of which end of a long feeder has the greater absolute power loss. Using 'reductio ad absurdum' and 'rule of thumb' (two very dangerous principles!), I feel that it can only be at the TX end. If the cable is really long, any power left to be dissipated at the load end must be negligible compared with that available at the TX end.

In response to your two posts...

You might be informed of the traditional graphs (or simple underlying formulas) of "Additional loss due to VSWR" that appear in some publications including several ARRL publications.

The formulas on which these graphs usually depend rely on a set of assumptions that are often, if not usually, not stated.

You could be forgiven for interpreting these things to mean that loss per unit length (in dB) is constant along a transmission line independent of VSWR.

The traditional RLGC model of a transmission line does give constant loss per unit length when VSWR=1.

For most practical lines at HF, most of the loss is due to conductor loss (the R term in RLGC) and very little due to dielectric loss (G in RLGC). The result of that is that line loss in any incremental length is very dependent on current, higher in regions of higher current, and lower in regions of lower current.

Consider the loss in 1m of RG58 at 3.5MHz with a 500+j0 load. It is a very short line electrically so current is almost uniform. VSWR=10 and current is approximately 1/3 of that for a matched line for the same transferred power.

Why should loss be greater than a matched line when I^2 is one tenth the matched line case? Well, it isn't. The formulas and graphs do not apply because the (often unstated) underlying assumptions are not met.

Regarding the dummy load, it might seem intuitive that loss is highest where the VSWR is worst, but that is not correct. The correct answer is found by calculating the loss along the line.

If you consider the case of 100m of RG58C/U with O/C termination as a dummy load for 1296MHz...

Lets section the 100m into 10+90m.

Using TLLC (http://www.vk1od.net/calc/tl/tllc.php), the input impedance of the last 90m is 50.00-j0.01.

Now lets look at the first 10m of our 100m, it has a termination of 50.00-j0.01 and the loss is 8.5dB, only 14% of the input power flows into the last 90m, 86% if the input power is lost somewhere in the first 10m.

By the same method, you could find that almost 20% of input power is loss in the first metre, even though the VSWR in that section is almost perfect.

Owen

> Do you expect it to vaporize and set your roof on fire?

Well, engineering of lightning protection is about design of a protection system that will, amongst other things, survive most events so as to continue to provide protection, and to minimise incidental damage.

So, yes, down conductors adequately sized to manage the risk of the conductor "vapourising" is part of the scope, and physical design to minimise the risk of side flash causing damage is also part of the scope.

It is interesting, no confusing, that you have two guides that give such different guidance. In Australia, we too have a standard for house wiring, and another standard for lightning protection, but they are not in conflict and our standard for lightning protection is well aligned with NFPA 780 on the downconductor size issue.

That is indeed very interesting - and illuminating. I've always assumed that, for electrically long feeders, most of the power got lost at the input end - but I didn't realise that the effect was so dramatic. I must do a few calculations for myself!

And as for electrically short feeders, I do see how the greatest power loss is where there are current nodes etc (although, presumably, averaged over a halfwavelength, the power loss will still be greater towards the TX end). But I now recall that some time ago, there was a lengthy discussion (in this NG, I'm sure) about how a matched low-impedance feeder could actually have more loss than a mismatched relatively high-impedance feeder.

I chose a case that would be clear. When the line loss is low, it is not
so dramatic. Trying to find Rules of Thumb in all of this is fraught
with problems.

Well, if you do some calcs yourself, what you learn will stick in your
mind. Just be sure that your study is reasonably comprehensive so you
don't come away with some new, but flawed, Rules of Thumb (RoT).

You could persue the dummy load example a little further. How long does
the line need to be for VSWR<1.1, and if the continuous dissipation
limit of RG58 is say 6W/m, what is the continuous power rating?

Owen

Even then, the same principle applies, at least on HF. If the standing
wave current maximum point is located near the load and the standing
wave current minimum is located near the source, the maximum
transmission line losses due to SWR will be near the load. If one
reverses those conditions, the results will reverse. As Owen suggests,
plot a graph of I^2 along the line - pick your particular load point
and particular source point and almost any outcome is possible.

The thing is, AWG 6 wire won't vaporize or even melt or even get warm to the touch. There's not enough "action" (I^2 T) in a lightning stroke to do it. Remember that the current is high, but only lasts a matter of a 50-100 microseconds.

Say you are using AWG 10 wire which has a resistance of 1 milliohm per foot. a 50 kA strike will dissipate 50E3^2*1E-3 = 2.5 MegaWatts.. which is big.. but for 50 microseconds, that's only 150 joules. That same foot of wire weighs about 1/2 an ounce (I'm sorry for the customary units, but they are what I remember off the top of my head AWG 10 is 1/10th inch in diameter, 1 ohm/kft, and 32 ft/lb).. or about 14 grams.

Specific heat of copper is 0.38, so we have deltaT = 150/14 * 0.38 let's call it about 4 degrees C.

I should note that this is a bit optimistic.. the AC resistance for a 50 microsecond pulse will be higher than for DC because of skin effect (skin depth at 1 MHz is 65 microns, 2.5E-3 inches, and it goes as the square root, so even at 100kHz, it's still not much more).. so the dissipation will be higher.

But, you've got a long ways from 30C to 1000C (melting point of copper) and even farther to "vaporization"...

(as a practical matter, you need kiloJoules to explode a 1 meter AWG 30 copper wire.. hundreds of joules just "melts" it.)

(note also that while the peak current might be 50kA or 100kA, the average current is substantially less..)

Mechanical stresses from magnetic fields are a bigger concern, as well as "sideflash".

No, I got you. Soon as you stepped though the logic, the match became
quite clear as a "third leg" ... glad you have a "happy amp" ... but if
the amp goes overboard, escalates its' state of happiness and goes into
the "gay zone", DUMP IT at the nearest swap! <stoopid grin>

Regards,
JS

Cecil,

As you have presented this argument in the past, it cannot either be proven, nor dis-proven--and must be considered.

If it were not for the fact that life is the sole "thing" which possesses such unique qualities as to behave as something from a conscious mind, something requiring more than nature to create it, requiring more than accident to have achieved its' present state, I'd have to give what you present much more weight. We must agree that "things" look different to us, at least on this one subject.

As I stated, in slight different words, it is H*LL to be human ...

Regards,
JS

Well, that's not a problem anymore. My dog killed him a couple months
ago. It was an accident. And even if it wasn't, after you've seen your
dog kill Cthulhu what is there left to fear?

At the transmitter end. Suppose you have a 100 watt transmitter and a cable with 3 dB loss per 100 feet.

50 watts is lost in the first 100 feet
25 watts is lost in the next 100 feet
12.5 watts is lost in the next 100 feet

and so forth. If you were to divide this up more finely and plot it, you'd find an exponential decay of watts loss per unit length versus distance from the transmitter.

You might find Fig 10 at http://vk1od.net/transmissionline/VSWR/displacement.htm interesting. It is a plot of the power along a length of mismatched line.

The plot doesn't answer your question directly, but the slope of the line in Fig 10 is the answer to your question for the scenario modelled. The slope is steepest around the current maximum nearest the source.

Fig 9 is interesting as it shows the loss for a mismatched line can dip below the loss line for VSWR=1.

The thing that becomes apparent from Fig 9 is that the common practice of doubling loss for double the line length works for the VSWR=1 case, but not for the general case. As a mismatched line is lengthed, the *increased* loss for each *extra* metre of length *approaches* the matched line loss and the line length approaches infinity.

Owen

What is it? Am I the only one here to realize that Art Artstein is really John Hutchison in disguise? That his tesla coils bend reality and turn steel to rubber? I was just joking around about him being a mooselum ... or that he is zealot in the following of moo-ham-ad ...

Sorta. The old testament says (somewhere) that about 600,000 left Egypt. No clue how many followed Moses into the desert as most just wanted to leave the scene of the disaster (10 plagues). 40 years later, about 25,000 entered the promised land with Joshua. Most of the 40 years was probably spend building and training an army, so there must have been a major reduction in followers in the desert. The actual numbers are highly debatable.

As for "bad ways", that's also debatable. For example, what's the difference between a bribe and a commission? The only difference is when it's paid. A bribe in advance, a commission after. In most middle east cultures, bribes are necessary to secure ones profit.

Anyone taking a commission is usually deemed a fool. Yet, western
culture defines taking a bribe as evil, and a commission as desirable.
So, who's acting badly, and from who's perspective?

>These were not receipients of
>the "promise" so what is going to happen to them when they lose out on
>judgement day?

Same as what we do today.... bribe the judge and pay off his cronies.

Hmmm
Then it would appear that the promised land was only given to less
than 10% of those that left in the first place! Maybe Gaza will be
large enough for those that followed thru. Grin. I would imagine that
decimation could avoid that strip of coastal area.
Maybe agreement will come after all, but not this or the next time
around as Israel has not stopped gaining ground.

Profit! Well it wasn't money which is the pursuit of the day. An old
woman gave up her only coin, a farthing, and got the jackpot !

Well, it does take a bit more than a farthing, but it's still
possible:
"Israel's biggest lottery winner claims prize after 4 months"
<http://www.haaretz.com/news/israel-s-biggest-lottery-winner-claims-prize-after-4-months-1.284172>

After crossing the Red Sea, the next step was to setup an antenna and
make some contacts on the other side, which would certainly have
qualified as a new country. Not having any wire antennas handy, we
used the next best thing:
"Sea Water Antenna"
<http://www.youtube.com/watch?v=9tIZUhu21sQ>

We claimed abandonment by the other interested parties.

While enforcing a 3000 year old land claim might seem a bit odd, we do have some of the best documented evidence (i.e. the Old and New Testaments) which have stood up in the courts for at least 2000 years. The only problems have been when deconstructionist academics and movie producers attempt to reverse engineer the intent of God. This might have succeeded had they been successful at issuing a subpoena asking for explanations and corroboration of the land claim.

>Maybe Gaza will be
>large enough for those that followed thru. Grin. I would imagine that
>decimation could avoid that strip of coastal area.

Decimation means 1 out of 10. That's been deemed politically inexpedient after the Romans tried it, and found it useless. These days, we just build a wall down the center of the country.

>Maybe agreement will come after all, but not this or the next time
>around as Israel has not stopped gaining ground.

Agreement has always been easy. Keeping the agreements has been the main problem. It isn't just the Arabs. We have the same problem. Get 10 Jews together to form a minion, and instead of agreement, we have an argument. It's a miracle that we've gotten this far, being so screwed up, but that's just evidence that God is on our side.

The losses and problems with that will keep a tinkerer quite happy for a lifetime. Reminds me of an old antenna I seen which used a thick quartz tube and was filled to appropriate heights to tune resonance. Was very interesting, and a fun toy for the owner, but I am waiting to see it in mass production.

Regards,
JS

>The losses and problems with that will keep a tinkerer quite happy for a lifetime. Reminds me of an old antenna I seen which used a thick quartz tube and was filled to appropriate heights to tune resonance. Was very interesting, and a fun toy for the owner, but I am waiting to see it in mass production.

For some, no proof in possible, even with YouTube videos.

Let's pretend you just marched across the Red Sea, on sea urchin and coral encrusted sandals. You follow Moses until you get to Mt Sinai. The boss then disappears up the mountain, and comes back with some rather draconian rules and regulations. He then grabs all the metal he can find and uses it to build the Ark of the Covenant, which was suppose to be some kind of transmitter to talk to God or perhaps aliens in their flying saucers. With all the metal used, what do you use for an antenna? Of course, salt water.... and you wonder why part of the Passover ritual is dipping just about everything into salt water.
<http://en.wikipedia.org/wiki/Ark_of_the_Covenant>
    God was said to have communicated with Moses "from between
    the two cherubim" on the Ark's cover (Exodus 25:22).
One theory has it that the Ark was an arc lamp, which is close enough to a spark gap xmitter to qualify as a transmitter:
<http://einhornpress.com/holyark.aspx>

Ok, let's forget the salt water antenna. Maybe an inflatable antenna would be more practical. An inflatable antenna certainly would be more useful for getting cell phone coverage for the multitudes in the middle of the desert:
<http://www.youtube.com/user/ltaprojects#p/u>
<http://towers.ltaprojects.com/LTA_Towers/LTA_Tower_Home.html>
(formerly Bosch Aerospace). Can you hear me now?

Looking into the modern theories of Aether, your statement is correct.

The problem I have with the new Aether theories is that they take the intellectually inexpensive leap from science to something else.

Quote from Wikipedia

"John Bell suggests the aether was wrongly rejected on purely philosophical grounds: "what is unobservable does not exist""

By which this time, we might as well fold the tents and go back to the easy answer, because if we take that tack we already have all the answers for everything in the universe.

There's an old New Yorker cartoon with a couple of scientists standing at a blackboard. The blackboard is covered with aequations, and right in the middle of them in paren is "And something really awesome happens", folled by more equations. That to me is Aether theory.

Might as well just say the answer is because God wants it that way.

On TV news last night they showed a video of a police officer talking to a man resting on a sofa in his own home. His wife had called saying that he had a heart attack and should go to hospital. The man refused to go
preferring to rest rather than go to hospital for treatment as he could not afford it. The police officer then tazered him to make him go to hospital! The chief of Police said that standard protocol had been followed.
Only in America!!!!
I wonder if he is still married to the woman
or he cancelled his insurance policy?

A "leap of faith" is required for a belief in God, the beginning of a religion. So, to me, most atheists look "religious" to me. Their religion is akin to having two men walking along in some far flung universe when they stumble upon a man-made car. The appraise it, toy with it, climb in and take off.

Now, down the road, one man says to the other, This appears as if it was made by god," the other mans says, "That is ridiculous, this obviously evolved from the elements around, and simply natural laws seen to its' creation."

The whole universe, everything we see, I must wonder if "it always was." Or, if a thinking mind constructed it all, even down to constructing the laws for it to exist in, then the bizarre question of my own existence enters this wonderment. It is easy to say that the ether was, is and always will be--we are born into it.

Atheists just have an easy way of accepting things. They look at all of this/these "MIND-BLOWING MIRACLES", and just say, "Oh yeah, it is natural for all this to exist, there is no such thing as an "absolute nothing", it is a law that if you universe sized space, it is filled with matter in an altered state from the ether."

And, even worse than that, many can't/don't even recognize an ether for the matter to have been created from and exist within. I do admit, my mind finds such simple acceptance shocking ...

Regards,
JS

Art,

Was he holding an antenna?

Anyway, if I'd been present, I would have been arrested.  I would have
considered force, up to the point and including lethal, would have been
justified in stopping such a revolting display.  Somehow, tazing an ill
man having, apparently, a heart attack/pains puts that individual
preforming the action below chit, in my world ... sad, so very, very sad
... it is why the wife and I are considering a move to Montana; I just
hate the cold.

Regards,
JS

Non jews in Israel will never accept expulsion to the
new palestinian State in Gaza so that the land of Israel can be
totally segregated and jewish. Yet until that happens the opening of
the heavens cannot happen without involving the destruction of non
jews!
A predicament has been written!

I'm sure it was all done with the best intentions. What probably
happened was that the police officer suspected that the husband's heart
rhythms had gone all twitchy, and he needed to apply a spot of instant
defibrillation to save his life.

But rest assured that this sort of thing doesn't only happen in America.
In the UK, where the police still, for the most part, do not carry
firearms, they now carry a veritable arsenal of supposedly non-lethal
devices (including tasers). While these are only supposed to be used as
a last resort, when a miscreant cannot be subdued by the more
traditional methods, they are increasingly being used, as in America, to
ensure instant compliance.

You are confused, again, Art. The promise was to the Hebrew people,
not the "Jews". Very few of the "Jews" in Israel today are Hebrew.

Paul

AFTERMATH.
The judge dismissed charges against the police officer after being shown police rules that recipients of a tazer gun MUST be taken to hospital prior to internment.
The same judge dismissed divorce proceedings stating irreconcilable differences had not been proven and the husband was to pay all court costs.
The above part anticipates what is yet to happen.

Yeah, may even be looking at our next president, the cop.

That kind of judgment, logic and actions seem popular with our
criminal/treasonous public servants, these days ...

Well, I did jump to a conclusion, based on insufficient data.

This cops' heart might have been in the right place.  He needs a caution
given to him and partnered with a more level headed officer.  He may
actually have what the public wants/needs ...

It speaks horribly of Amerika though, we need a "kinder/gentler" way of
providing assistance to those unable to afford it ...

AFTER AFTERMATH
The husband on hearing the judge speak fell to the ground gasping and clutching his chest. He was taken to hospital with his wife by his side and who stayed at his bedside where further enquires listed his condition as ..."grave".

Did he have an antenna in his hand in the courtroom? Did anyone mistake it for a weapon? Was it a loaded antenna?

Art, supply all the data so we can make proper statements!

Heh, this group is so full of negativety and poor judgement so I
thought that Katie Curic news story
yesterday should be jollied up a bit, so that instead of laughing at
others we should try being the recipient to see if our actions hurts
others.
Have a great week end.

Nice try.  But, I ain't stoopid, yanno'?  You avoided the part of if the
antenna was loaded, or not!

Why thank you for that titbit! I had never heard that before today.
Maybe I should back off and go back to physics where I can give
titbits to others and fill in their gaps of knowledge
Regards
Art

FLASH
News release
Husband momentarily opened his eyes. Turned and saw his wife and
immediately lapsed into a self induced deep coma.

Zero resistance is not strictly a function of direct current. It is simply the most often reported experimental characteristic in the popular press. Impracticality of the additional RF characteristic (which I presume in this forum to be confined to UHF and below) is unwarranted in materials research at this point, but EHF/IR and above results are frequently reported in association with other research - plasmonics and phonon/electron interaction.

The resistivity of copper falls with temperature, true, but we encounter diminishing returns as we approach absolute zero: the drop fails to follow through to the expected final zero resistance. This was an experimental dissappointment decades ago. Silver and gold are rarely chosen for their electrical properties in the nano-dimension - chilled or otherwise (although gold is suitable, gold is far more useful in association with thiols). In fact, what are typically poor conductors exhibit less low temperature resistance than copper (cold or warm). I won't go into that list, it is enough to consider that such "wires" would be confined to thin film depositions on a flexible tape substrate - pretty exotic.

Going further, it isn't even necessary to drive temperatures to the basement for improved conduction. Carbon nanotubes are exemplars of high conductivity (several orders of magnitude better than what we consider good metals) at room temperature where a carbon macrotube would be called a resistor. Conductivity and superconductivity research has long ago left the realm of temperature and has entered the realm of crystal alignment.

However, even this academic. Carbon Nanotube construction at a scale to compete with standard copper wire is off by a scale of a million to billions (of dollars, much less practicability).

Are many of Aether theories:
http://en.wikipedia.org/wiki/Timeline_of_luminiferous_aether

Some of them were erroneous.
But the question what is the medium for radio waves remain.

There are the two issues. Is it movable or not and what is made of.

The first was judged by Michelson:

"1925 - the Michelson-Gale-Pearson experiment produces a positive result while attempting to detect the effect of Earth's rotation on the velocity of light. The significance of the experiment remains debated to this day, but this planetary Sagnac effect is measured by ring laser gyros and taken into account by the GPS system."

So we know that the aether rotate with the Sun but not rotate with The Earth.

The last proposition for the second was made by Dirac. In space is en electron see. So the medium for radio waves are free electrons. In the space are also ions, atoms and dust. It has name Interstellar Medium (ISM).

> to your favorite "dark matter" For that matter explain what a "medium"
> is in physics terms.

>Art, you don't seem to understand that there is a quantum base medium
to which some other medium may or may not be added. The base medium
exists throughout all of universal space and is the only medium that
exists in otherwise empty space. Any other added medium, e.g. air or
water, is just mixed with that base medium. Please stop thinking with
a concrete brain.

In the "physics terms" the base medium is Dirac electrons see.
The "added medium" are ions, atoms and dust. All are produced by Stars.

The same mixture is in metals. In metals the free electrons are medium for
the electric waves and ions and atoms for the acoustic waves.

Maxwell-Heaviside ether was like the dielectric.
The todays ether is like rare plasma. Plasma is a conductor.

On Aug 30, 6:39=A0pm, Art Unwin <arthurun...@gmail.com> wrote:

> Frankly I just do not understand your response.

Outside of the space-volume of the universe, there is no structure. Inside the space-volume of the universe, there is an invisible quantum structure everywhere. You live and function within that structure without being aware of it. That quantum structure may or may not contain visible matter/energy which can modify the electromagnetic characteristics of the medium, but does NOT replace the quantum structure as you appear to think. The quantum structure is the container of everything that exists. Nothing exists outside of the container (unless there are more unconnected containers somewhere else).

Air, water, or earth does not displace the quantum structure but gravity can warp it, e.g. black holes. Everything that exists in our universe is contained within the invisible quantum structure which appears to consist of dark matter interacting with dark energy. It is believed that the pressure of the dark energy is overwhelming gravity and is causing the expansion of the universe.

I'll drink to that. Consider a transmitter connected to an antenna
tuner by a piece of 50 ohm coax where the SWR is an ideal 1:1 on that
short piece of coax. There are no reflected waves on the coax.
Therefore, no reflected energy reaches the source. Energy transfer is
a one-way process on that flat piece of coax. Except for efficiency,
the source impedance doesn't matter. Whether the source impedance is
10 ohms, or 50 ohms, or 200 ohms, dissipative or non-dissipative,
reactive or resistive - just doesn't matter. All that matters is the
voltage delivered to the 50 ohm Z0-match at the tuner input.

Cecil as I stated before a electron can travel thru
two mediums OR along the path between the two mediums. The presence of
surface wave of propagation points to another medium whether it be
between Earth and the atmosphere OR the atmosphere is a medium itself.
It is because of this
electron travel along the surface of Earth that scientists come to the
conclusion that the atmosphere is a medium which they name.
This is not accepted by mainstream but to be fair mainstream has not
named or explained the medium that allowed for over the surface
electron travel.
From my point of view the "missing" medium is a carpet of free
electrons that are bound in a skin as seen on surface tension on water
and it is this skin
or carpet upon Earth is the medium that explains the surface travel of
electrons, a missing medium that satisfies both sides of the puzzle.
Regards
Art

By golly, I believe you are getting it ... except for you focus on "a surface." We have a medium to test all this with, which is quite suitable. Water; No surface is needed to produce sound within a body of water, itself, water serving as the example of "ether." A very strong, varying, magnetic field, in the audio range, can work upon the slightly magnetic atoms producing the sound. In passing, "pumps", which may someday propel vessels, can also use this effect to "pump" water though a coil and propel the vessel. Ether should be able to be manipulated in a like manner ... now, unless you show up upon my doorstep with a workable model of an "ether antenna", this all has, and will remain, of little use. However, I think you are just the man to do it, Art. <wink>

Just when I thought you were getting it too ... you need no dust, no matter which you can touch, to have emf produced and transverse-ing the universe(s.) See, you are still focused on that "surface."

John
Cecils interpretation of a double helix was what is termed as the
secret of life with is the combination
of two vectors direct an circular or spin which generated the double
```

helix. This can also be explained as the secret of everything in the
scientific world whether it be the two vectors created by the BIG BANG
or the two vectors of gravity and rotation and on to the two vectors
as an electron travels between two mediums. All this was proposed
centuries ago purely by observations.
Think of a piece of caramel being moved outwards
along its length, necking occures and bingo you have the other vector
pushing in from the sides.
When Newton stated every action has an equal and opposite reaction he
was not thinking of a singular force or vectors but of two.
The two vectors can be seen in action when caramel is being pulled.
You have an equal force
as a reaction to the initial pull and you also have another vector
generated on the other or opposite side of the caramel that creates
the necking or thinning where opposite in OLDE ENGLISH terms
was a 90 degree change in direction and not one that is actually
opposing the initial vector.
This approach is the same as that of Einstein with the STANDARD MODEL
which eventually comes down to just the combined action of the said
two vectors which again supports the action of a ground wave between
two mediums. Maxwell pointed to the same thing when he recognized that
is law on radiation required a second vector(displacement current)
which finally put the mathematical expression into the "must have"
requirement of EQUILIBRIUM. Now both supporters of the AETHER and its
deniers can be satisfied by labeling the particle carpet as the
missing medium, which by the way was identified by Gauss with his laws
on static particles. So Cecil
is quite correct on his explanation of quantum soup
which in itself is not a medium as required by the two vector system
but by the identification of the missing medium which is the carpet
layer from the Galaxy resting as a mantel upon Earth.
Regards
Art

John

We now come down to the question as to whether the two vector explanation is of any use by applying it to antennas.

Let me come back to the double helix or the "genome" of life

Science views a coil as a load with respect to antennas or a dummy load again with respect to radiators. We all know that a coil can be made where it is totally resistive and completly absent of reactive forces because with the about turn of direction of current flow stops the formation of both capacitive and inductive vectors.

When the current flows thru the coil tradition points to science as seeing this as the metallic resistance of say aluminum. This is false in that the resistance seen is the resistance to the skin depth anomally created by the foot hold of a external magnetic field.

In this case there cannot be an external magnetic field ie no reactances and therefore no skin resistance. Now it is this resistance that was keeping current flow from rising to the SURFACE of the radiator such that the radiator is not now the path that the current takes which is now BETWEEN the two mediums such that its two vectors direct current and displacement current can devote itself to purely producing radiation by ejection of particles with spin. So in other words the external magnetic field by creating skin depth is the worst enemy of radiation which is the creation of a wastefull friction component. Removing that magnetic field is the same as what superconductors do except in radiation current flow by passes the subject mass regardess of its resident friction where as a superconductor actually reduces the mass friction instead of by passing it.

When applying this to computor program the radiation patter evolves into two separate patterns merged into one wher the axis reflects the two vectors of gravity and rotation.

As a side note the radiatin member is never totally devoid of resistance ans it now takes on a vibratory action from the levitating vector on its surface, so ohms law stays intact by virtue of the change over to pendulum mathermatics

Regards

So John we now get to the final portion that closes the loop with
respect to radiation. The method of winding the coil is similar to a
solenoid without the central plunger. Around a solenoid is a shield to
retain the external magnetic field. This very arrangement is exactly
that of a Faraday shield but with two openings top and bottom and the
Faraday shield has the unique property of separating electric,magnetic
and time varying current into separate parts such that it is in effect
both a transmitter and receiver where as lternating current can be
used to form a tank circuit or alternatively
separate the time varying current back to drive a receiver. So the
same as what is required for a Faraday shield is also required for a
radiater which is a bleed line between the outside of the shield to
ground to remove static from the system. If one puts the solenoid or
Faraday shield over a
reflsector then we have two patterns each on a separate axis but
superimposed upon each other where the center plume relates to
gravity.
The above in no way violates existing laws for electrical components
and in fact support those in existence made by the Masters. All the
above enfolded by reviewing existing laws and expanding
thbe Gaussian static laws into dynamic form as the leader in the
resulting trail. Remember a vertical antenna must be tipped with
respect to Earth to reflect two vectors so it attains equilibrium.

```
Regards
Art Unwin KB9MZ.....xg
then one has a directional antenna which has two

Yes, it was a nice description ...

Uh, huh, so that is what "... created man in Gods' image ..." means, the double helix! I'll be looking for one descending from Heaven soon!

Keep up the good work,
stiff lip and all that,
regards,
JS

Art,

You waste your words on me. I will only cop to a few things:

1) I believe the ether is real and it exists about us, in us, everywhere.
2) All our "real matter" was ripped from the ether and is just ether existing in an altered state, "this all" is not "normal."
3) Although we can't "see" the ether (yet), we can make guesses from its' apparent properties. One important one, it is a superconductor. EMF can, apparently, transverse it forever with no "loss" (some will mention a "red shift", or "slowing", here.)
4) "Discovering" it will boost our economy, flood our markets with uncountable new devices exploiting its' properties and raise mans' scientific knowledge to unfathomable heights ...

Beyond that? Who knows ... I think, at this time, your ramblings are just as valid as any I could make, about it, the ether ... since yours sounds so "crazy", I hesitate to go into such depths ... sorry ... remember, "fools" (well, Einstein did) run where brave men fear to go ...

The "double helix", as it involves antennas, is only a trick to me. And, use to coax certain actions/behaviors from an antenna. It is physical in existence and can affect antenna fields and other properties ... it is no more profound or magical than a gamma match, capacitive hat, etc., sorry ... at this point, this is all I want to know.

Regards,
JS

John We live in a World that is not of our making.
It is us who search for the release of energy from that around us so
we can live the life we live. We have used electricity to create light
we did not generate the initial supply. Same goes for oil gas and wind
which uses the same two vectors supplied to us. But these energy
supplies are not enough to sustain the future and science cannot
produce new energy only to understand what is around us so that we can
then make the most of it.
Yes we use magnetic power to move friction to conserve energy by
levitation and what goes with that knowledge is the solenoid that
really is a double acting single cylinder that converts knowledge of
what we know into energy. The windmill uses the two vectors of the
weather straight and rotational and we know what the energy does
there. Now we have a faulty electrical grid system that must be
replaced and ideally Ac current is best for that but for the losses.
Now I point to a way of bypassing those same losses, a new ladder to

climb. By the way if you decide to make the antenna put a 20db
anttennuator in the line first to avoid destruction of the front end.
When I first connected up to 10 meters it wasn't open but the meter
shot over S9 forcing me to shut down quickly. When experiments with
superconductors for antennas 20 db improvement was noticed so one has
to be careful. A MRI can project a personal object being worn by a
patient
out of his clothing and thru a substantial wall so tread carefully.
Remember a lightning strike is nothing more than the static energy of
a particle seeking a place on Earth that it can rest after losing its
resting space created by updraft and temperature change. We know the
energy is there
the trick is to harness it.
Regards
Art

John
If we follow the pied piper on a well trodden trail then education is
plagerism at its worst.
Being like Jack with the bean stalk means curiousity leads you on a
path that is not well trodden but produces surprises and new vistas
never seen by man!
Heh I like how that sounds, very profound.

Art,

You play to the choir.

Everyone who has found something new, has first had to surmount and defeat ridicule and/or worse, before all claim him to be a genius. But, doing such, surmounting/defeating ridicule, does not guarantee finding something new.

There are many more men sitting in "nut houses", and "searching," than there are discoveries to be made ... a wise man would tread the grounds cautiously, as I have mentioned ... LOL

Regards,
JS

John the question you raise with regard to the tank circuit is very
valid. But when a superconductor is used as a radiator removal of the
time varying current is consumed by losses
Let me propose the following, presently it is assumed that the super
conductor resistance goes to zero which embraces perpetual motion if
losses disappear. What if the current rose to the surface
like my antenna which is determined as the "Meissner effect". The
material is being bypassed
and replaced in the circuit by resistance traveling along the surface
which gives you the analogy of the long pendulum. One has to be wary
of embracing perpetual motion as in itself it destroys all we have
determined in physics.

After Jesus "died" he appeared three days later where he spoke to Mary
Madelyn.
He had to caution Mary not to touch him as he had not yet prepared
himself to levitate into the heavens. This was akin to changing
himself into water such as with a frog that scientists have shown to
be levitated and life has shown the appearance of fish and frogs in
roads miles away from ponds after a storm. Something to ponder over.

Uh, Art, it is called a waterspout and/or tornado.  It sucks 'em up at
one point and drops 'em at another, can't blame the aliens this time!

No John I am not jewish! But there are other instances as per the
parting or updraft of the Red sea which later came back down to reseal
the path.
I am not making this up as it was written well before I came along but
there is some similarity even tho I cannot explain it. One thing that
was also written at the time that only a few jewish people continued
on the journey while the majority
stayed enjoying their former bad ways. These were not receipients of
the "promise" so what is going to happen to them when they lose out on
judgement day?

No you can't blame aliens but you can blame those two vectors that
demonstrated their strength. grin

OK. Since the real Art Artstein has been missing for quite sometime, and
has been replaced with a cleaver alien clone ... it leaves me no choice
other than to involve the authorities in this.

Will the real Art Artstein please stand up? Else, you give me no
recourse! <straight faced>

Regards,
JS

Roy:

My post showing very high input SWR at the base of an unloaded, base-driven, 10 foot vertical on 3.8 MHz described an UNMATCHED system resulting from its connection to transmission lines of typical impedance values. It did not include matching networks, whether located at the base of the vertical radiator, the output connector of the transmitter, or wherever.

Then you posted, "Using your antenna as an example, suppose that a transmitter with output Z of 50 ohms is connected to a tuner that transforms its output impedance to 0.6 + j1250 ohms. ... The transmitter will see 50 + j0 ohms, the antenna will see an impedance of 0.6 + j1250 ohms, and full power will be transferred."

That configuration you posted is a MATCHED system, and its performance does not disprove the accuracy of my post.

So you're saying that the mismatch between the impedance of an antenna
and the transmission line connected to it doesn't inhibit power flow

when there's a matching network anywhere in the system. But it does interfere with power flow when there's no matching network?

What if the antenna is 50 ohms and the transmission line is a half wavelength of 600 ohms, for a 12:1 mismatch? There's no matching network. The transmitter sees 50 ohms. The antenna sees 50 ohms. What will interfere with the power flow?

Roy Lewallen, W7EL

This, and your other what ifs describe a system *different* than the
one in my post.

The performance of the systems you described does not apply to the
system I described, and vise-versa..

I've definitely gotten lines of various sizes stuck in tree crotches if left unmoved for an extended time.

I have been advised, (but have not take the advice!) that running the rope through a garden hose, which is sitting in the crotch, is the way to prevent this from happening.

If I were climbing the tree to get the line up there, that'd be easy enough to do, but using a cannon to send the line over it's not so obvious. I'm thinking right now, with my 1/4" rope, that maybe I could use the rope to pull a hose (not as thick as a garden hose maybe) up itself.

John he doesn't bother me. The more he posts the more people
understand what a child he is.
Soon somebody will go to a modeling program and try it out and it will
all be over. I am not fully familiar
with Eznec but I understand it already has a sample
of a coil which makes it easy to duplicate to try out above UHF. A
condensed antenna with extremely high gain is very desirable to the
ham community and elsewhere so interest will win over in the end.
Thanks anyway for the support, you can't be an engineer for very long
if the bridges you build keep falling down and I worked as a senior
engineer with G.E. for most of my life so I have walked the walk.
I forgot to mention that this antenna does not have a formal bandwidth
as it is resonant on all frequencies up to the length of wire used for
the lowest frequency.As the wire only carries a minimum of current it
can be quite thin and resistance is so small it is not a problem to
use
loads of wire and still maintain a condensed antenna. Mine is light
enough to hold up with one hand and place it in the rotor on the tower
top and is good down to top band. Sounds crazy but I have provided the
physics which is supported by my actual antennas as well as the
computer programs.
Regards
Art

I had some spare time today, to just let my mind wander.  You know how
mooselums must face mecca each day?  I wonder if moohamad ever gave any
advise what direction mooselums should face their antenna?  A sloper,
facing mecca would seem to be suitable; Indeed, the antenna would almost
be in a "praying conformation!"  I mean, surely, no fault could be found
with a mooselum utilizing one of those babies!

You ever given much thought to that?

Regards,
JS

```

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/
d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Apparently, tree climbers use a wide strap called a "cambium saver" to
protect the bark and allow lines to run freely. The following link shows
how it may be positioned in the crotch of a branch, and even retrieved

after use, working only from ground level:

<http://www.instructables.com/id/How-to-get-a-rope-into-a-tree-without-climbing-it/>

Roy, you may have a chance to try this, sooner than you think!

In my simplistic world, this is how I understand things:

Provided the TX is followed by a tuner/matcher, which matches whatever is attached to the tuner output to 50 ohms at the tuner input, the TX will be happy.

The power loss in the feeder is essentially a function of its inherent loss (when matched) per unit length, and the SWR on it.

The SWR is a function of the mismatch between the load on the antenna end of the feeder, and the feeder characteristic impedance. The greater the SWR and the longer the feeder, the higher will be the loss on the feeder. 'Lossless' feeder have no loss, regardless of length and SWR. However, with real-world feeders, the losses rise increasingly rapidly with increasing SWR.

The impedance looking into the tuner end of the feeder is the impedance of the load, transformed by length of the feeder, and is also modified by the loss of the feeder.

The higher the feeder loss, the closer the impedance seen at the tuner
end will approach the characteristic impedance of the feeder. [Long
lengths of lossy feeder - maybe with a nominal termination on the far
end - can make good dummy loads at VHF and UHF.]

Wrong.

>

Well, the SWR at the load end is a function of Zl and Zo (both complex
quantities)... but the 'notional' SWR varies along the line as accounted
for by the complex propagation coefficient, in most practical cases at
HF, SWR decreases smoothly from load to source.

> greater the SWR and the longer the feeder, the higher will be the loss
> on the feeder. 'Lossless' feeder have no loss, regardless of length

See your earlier misconception regarding loss being a simple function of
SWR.

>
> The impedance looking into the tuner end of the feeder is the

You got that right.

>
> The higher the feeder loss, the closer the impedance seen at the tuner

Yes, but is it of practical application in a transmit scenario? If the
input impedance due to a severly mismatched load is at all close to Zo,
then you have lost most of the transmitter power in the line.

The "make a good dummy load" recipe doesn't address the power rating,
especially where most of the power is dissipated in a very short length
of cable.

Owen

How did that e get in there...

"Happy", a new dumbed down attribute of a transmitter. Everyone loves a happy transmittter.

What happens if they are not happy? Well, everyone knows you will let the smoke out of them (AKA reflected power is dissipated in the PA and kills transmitters).

Yep, a simple world... even if wrong.

Owen

That's the result of the 50 ohm Z0-match achieved at the input of the tuner which is responsible for the transmitter's "happiness". A Z0-match causes the incident reflected energy to be redistributed back toward the antenna through a combination of reflection and destructive interference.

Richard Clark wrote:

> Going further, it isn't even necessary to drive temperatures to the basement for improved conduction. Carbon nanotubes are exemplars of high conductivity (several orders of magnitude better than what we consider good metals) at room temperature where a carbon macrotube would be called a resistor. Conductivity and superconductivity research has long ago left the realm of temperature and has entered the realm of crystal alignment.
>
> However, even this academic. Carbon Nanotube construction at a scale to compete with standard copper wire is off by a scale of a million to billions (of dollars, much less practicability).

This may have changed also, I'm no expert in superconductors (though I do play one on TV) Don't the high temperature superconductors have issues with current capacity, and does this translate into problems with impedance?

Sorry, missed this earlier, must have hit, "mark newsgroup as read" a bit prematurely ...

Well, just guessing, I'd say, it came from the "immaculate conception", and Mary contributed ... but hey, mankinds DNA came form God ... I find it a much better question to ask, "Is God a "true God" or an alien, or alien race?"; And, "Would I be able to tell the difference if I ran into either?" And then, there is the question, "Where did God/alien-race come from?"

It ain't easy being human ...

Regards,
JS

OK, the loss may not be uniform if the SWR is greater at the load end.
But when is the power loss* NOT a function of its matched loss per unit
length, and the SWR on it. [*Should I have said 'in dB'? ]

As a termination, I've used a fairly long piece of coax plus, for good
luck, a low-power termination hung on the end.

> If the
>input impedance due to a severly mismatched load is at all close to Zo,

Quite.

>The "make a good dummy load" recipe doesn't address the power rating,

>of cable.
>
Oh, indeed. But I have to confess that I've realised that I'm suddenly
unsure of where, on a long, lossy, feeder with a mismatched load, most
of the absolute power is actually lost. I'm assuming that it is at the
TX end, where the power is greatest - even though that's where the SWR
is best. Please advise!

It seems logical that the highest I^2*R losses would be where the standing-wave current is maximum and the highest dielectric losses wold be where the the standing-wave voltage is maximum. As Owen is fond of pointing out, the locations of those points are very important. If a current maximum point exists at the load and a voltage maximum point exists at the source, the losses at the load are probably higher than the losses at the source on HF. If a voltage maximum point exists at the load and a current maximum point exists at the source, the losses at the load are probably lower than the losses at the source on HF (assuming that losses due to SWR are mostly I^2*R losses on HF).

I have two NEC 536300 relays for sale.  The specs are:

50 ohms input and output
150 Watts to 470 MHz
VSWR  1.25:1
Crosstalk 40 dB
12 VDC coil
Shown in August 1965 VHFer if you still have it.  I don't.

They can be viewed at:

http://home.comcast.net/~hsknoll/site/?/photos/
&PHPSESSID=29ec62ea0bf1fe4d25e318b011cf0bbf

or

http://tinyurl.com/yktwxpz   click on photo to enlarge it.

I'm asking $10 each plus shipping.
=============================================================
I have a Heath HM-2102 VHF SWR meter  50-160 MHz
0-25 and 0-250 watts. Very good condition.

I'm *asking* $40 plus shipping.

It can be viewed at:

http://home.comcast.net/~hsknoll/site/?/photos/
&PHPSESSID=29ec62ea0bf1fe4d25e318b011cf0bbf

The purpose and function of a loading coil used with an electrically short antenna is to offset the capacitive reactance of the short radiating section. Otherwise it will not accept much power from a transmitter or deliver much power to a receiver, due to a very high mismatch to common types of transmission line connected to its terminals.

Check this using a simple NEC model. The model will have ~ the same radiation resistance, radiation pattern, and gain in dBi whether or not a loading coil at the feedpoint makes the antenna system resonant, other things equal.

J. Kraus states in the link below that the radiation resistance of a loaded vertical (for instance) is nearly the same as that of an unloaded vertical of the same height.

That a loading coil contributes "missing degrees" to resonate a short antenna is rather a specious concept.

On the helix coil, of any helical wound loading coil, or even a linear
loaded monopole/dipole, you can wind another helix, in between the turns
of the first helix, both ends are open and not connected. This tends to
expand the antennas' bandwidth, "normalize" ant impedance, etc.

That is the only thing I can figure he is referring to ...

Having locked myself away for months, wife will claim years, and searching for the "best" shortened stealth antenna(s), I have been forced to employ coils. In any loaded antenna (hide the JD!) the coil is best at the bottom with a .62 L/D ratio. I currently use DLM's from Robert Vincents' patent, it allows me to break the laws ... others research and mileage may vary.

The loading coil adds +J to compensate the -J from a short antenna ... however, old hams taught me that the coil adds electrical degrees, God bless them ...

You can make it work but it will be Full Manual -- no indicator. The motor has two coils; the high side of each coil has its own terminal; the low sides are tied together to another terminal. These three terminals are powered from a corresponding trio of terminals on the box, two hots and a common.

The trick to CW or CCW rotation is that one of the hot terminals is driven directly and the other is driven through a capacitor. The control box switches the capacitor into one lead or the other, according to which way you twisted the knob or pressed the lever.

A clever fellow with a multimeter could identify which terminals belong to which function (on each unit) and connect accordingly.

Tom and Roy both measured *net* current - they did not use a
directional coupler. If they had used a directional coupler to measure
the current, they would have measured ~30 degrees shift in both the
forward current and reflected current through an 80m loading coil.

Let's talk about the net current in a 1/4WL lossless shorted stub.
Have you never looked at that equation? What is the phase-shift in the
net current from end to end in that stub? Exactly how do you
rationalize zero degrees phase-shift in the current in a stub known to
be 90 degrees in length?

Uh Richard, how does it accomplish that feat without a phase shift?
Aren't -jX and +jX, 180 degrees out of phase? Exactly how is a -jX
offset without a 180 degree phase shift?

In an electrical 1/4WL standing-wave antenna, like an 80m mobile
antenna, the phase shift between the forward wave at the feedpoint and
the incident reflected wave at the feedpoint is obviously 180 degrees.
Exactly how is that accomplished without a phase shift in the loading
coil?

There is a logical intuitive way to arrive at the phase shift through
a loading coil. Would you like to hear about it?

If the loading coil used to resonate an electrically short vertical
really contributed '"electrical degrees" arising from some
attribute(s) of the coil that made the short antenna system the full
electrical equivalent of an unloaded, 1/4-wave vertical, then please
explain why the loaded version does not have the radiation resistance,
and typically the radiation efficiency of the unloaded version.

RF

The radiation resistance and radiation efficiency of a short antenna, like any other antenna, depends upon the *physical* length of the antenna. Nothing can be done about that fact of physics where bigger is generally better. Short resonant antennas have a lower radiation resistance and therefore lower efficiency. Please do not confuse radiation resistance and antenna efficiency with feedpoint impedance where the reflected wave must arrive 180/360 deg in phase with the forward wave for the feedpoint impedance to be resistive and resonant. There is simply no other possibility.

The *feedpoint impedance* of a standing-wave antenna depends upon the *electrical* length of the antenna. If it is resistive, the reflected wave has undergone at least a 180 degree phase shift referenced to the forward wave. Otherwise, the feedpoint impedance would not be purely resistive. Make no mistake, a typical loaded mobile antenna is 90 degrees long and part of that 90 degrees is furnished by the loading coil. Note that I said "part", not *all* of the "missing" degrees. W8JI is correct about approximately half of the phase shift between the coil and the stinger. He is 100% wrong about the other half of the phase shift which occurs within the coil.

Here's a question for you: If the feedpoint impedance of a loaded standing-wave (mobile) antenna is purely resistive, how could the reflected wave arriving at the feedpoint have undergone anything

```
except a 180 degree phase shift?

Why is the feedpoint impedance of a resonant short loaded antenna
usually less than that of a 1/4WL antenna? Because the radiation
resistance is lower and the I^2*R losses are lower. But all resonant
shortened monopoles are 90 degrees in electrical length. Anyone
arguing against that fact of physics is just ignorant of how standing-
wave antennas work. That includes some otherwise knowledgeable
"gurus", incapable of admitting a mortal mistake, who post to this
newsgroup.

Yeah, like a superconductor would be able to "speak" to the ether
directly ... as, I think, Art is implying ...

Regards,
JS

>
> The purpose and function of a loading coil used with an electrically short antenna is to offset the capacitive reactance of the short radiating section. Otherwise it will not accept much power from a transmitter or deliver much power to a receiver, due to a very high mismatch to common types of transmission line connected to its terminals.
>
> . . .

Difficulty in getting power to an antenna is due to the mismatch between the transmitter and the impedance it sees, rather than between the transmission line and antenna.

As a simple example, consider a 75 ohm dipole connected to a transmitter through a half wavelength of 600 ohm transmission line. The transmitter sees 75 ohms. Most transmitters will deliver full power to a load of that impedance and, except for line loss, all that power is delivered to the antenna in spite of a 12:1 mismatch between the transmitter and

transmission line (assuming a 50 ohm output transmitter) and 8:1
mismatch between the transmission line and antenna. If you change the
transmission line impedance to 75 ohms, the transmitter can't tell the
difference -- it still sees 75 ohms and delivers the same amount of
power, even though the line and antenna are now perfectly matched.

For many years I've used a slingshot to put up antennas on Field Day. Even after just a day or two, they can sometimes be hard to get down, the twine having dug its way into the tree and gotten gummed up with sap. After those experiences, I've never been willing to put an antenna up permanently or semi-permanently by just getting a rope over a branch -- I've climbed and put a pulley part way up which I've had to replace every few years as the tree grows out over it.

Of course, larger diameter rope wouldn't cut into the tree as badly as the heavy twine I use for FD. But I'm sure it would still cut in and get stuck after even a fairly short period of chafing under tension, and the tree would grow over and around the rope before long. The result would be a rope permanently stuck in the tree.

So I'm curious how this ends up working for you. My trees are nearly all confers -- Douglas Fir, hemlock, sequoia. Are yours hardwood? Are other folks able to get away with this?

>Here's a question for you: If the feedpoint impedance of a loaded
standing-wave (mobile) antenna is purely resistive, how could the
reflected wave arriving at the feedpoint have undergone anything
except a 180 degree phase shift?

There are the two possibilities: See:
http://paws.kettering.edu/~drussell/Demos/reflect/reflect.html

1.Reflection from a HARD boundary "at a fixed (hard) boundary, the
displacement remains zero and the reflected wave changes its polarity
(undergoes a 180o phase change) "

2. Reflection from a SOFT boundary " at a free (soft) boundary, the
restoring force is zero and the reflected wave has the same polarity (no
phase change) as the incident wave "

So if the feedpoint is in distance 1/4 WL from the end you have 0 or 180
degree phase shift.

Which case is in antennas?
S*

>Why is the feedpoint impedance of a resonant short loaded antenna
usually less than that of a 1/4WL antenna? Because the radiation
resistance is lower and the I^2*R losses are lower. But all resonant
shortened monopoles are 90 degrees in electrical length. Anyone
arguing against that fact of physics is just ignorant of how standing-
wave antennas work. That includes some otherwise knowledgeable
"gurus", incapable of admitting a mortal mistake, who post to this
newsgroup.

In metals and plazma are the acoustic waves and the electric waves. In the
both are the two media: ions and electrons.

However an assumption might be taken from some posts here that a short vertical radiator loaded to resonance is the full electrical equivalent of an unloaded, resonant vertical of about 1/4-wavelength, while it is not. That is my point.

Rather than using an example of a balanced antenna having reasonably high radiation resistance and zero or low reactance at its input terminals, let us consider a base-fed 10 foot whip at 3.8 MHz -- which is more along the lines of this thread.

Without using a loading coil, the input Z of that whip is about 0.6 -j 1250 ohms. The SWR that this antenna input Z presents to unmatched 50 to 600 ohm transmission line ranges from 52,167:1 to 5,340:1.

Not much power will be transferred through such a match, which is the reason for the statements in my quote which you referred to.

> On Aug 29, 6:34 pm, Cecil Moore <w5...@hotmail.com> wrote:
> However an assumption might be taken from some posts here that a short vertical radiator loaded to resonance is the full electrical equivalent of an unloaded, resonant vertical of about 1/4-wavelength, while it is not. That is my point.

The short vertical radiator loaded to resonance *IS* the full *electrical* length of an unloaded, resonant vertical of about 1/4WL, which is related to the feedpoint impedance. It is NOT the full *physical* length which is related to radiation resistance and efficiency.

The feedpoint impedance of any electrically long 90 degree standing-wave antenna, including resonant loaded mobile antennas, is:

Zfp = (Vfor-Vref)/(Ifor+Iref) on the antenna, not on the feedline.

The reflected voltage has undergone a 180 degree phase shift. The reflected current has undergone a 360 degree phase shift. Part of the phase shift occurs in the loading coil. A typical resonant mobile antenna is *electrically* 90 degrees long. If it was less than 90 degrees long *electrically* it would exhibit capacitive reactance at the feedpoint.

Let's discuss a base-loaded configuration which is less complicated than a center-loaded configuration. (1) The delay through the loading coil is part of that 90 degrees. (2) The delay through the stinger is part of that 90 degrees. (3) The phase shift at the coil to stinger junction is part of the 90 degrees. Tom, W8JI, assumes a lumped inductor for calculating the phase shift at the coil to stinger junction but a 75m bugcatcher loading coil is NOT a lumped inductor - it is a distributed network existing in the real world with an associated real-world delay through the coil.

The other rail of the argument assumes all of the "missing degrees" come from the coil and none from the coil to stinger junction. Both sides are wrong. All three phase shift components listed above exist in a base-loaded mobile antenna.

(There are four phase shift components in a center-loaded mobile antenna. Degrees of electrical length are actually lost at the low Z0 base section to high Z0 loading coil junction. That's why the inductance (coil delay) has to increase for center-loaded configurations.)

Interestingly enough, a base-loaded mobile antenna functions like the dual-Z0 stubs covered on my web page and can be analyzed in the same manner:

http://www.w5dxp.com/shrtstub.htm

Here is a simplified approximate representation of what a base-loaded mobile antenna looks like electrically:

```
FP------Z01=5000 ohms------+------Z02=500 ohms------
```

The Z01 portion is the base loading coil and the Z02 portion is the stinger. The Z0 of the loading coil can be obtained from the inductance calculator at:

http://hamwaves.com/antennas/inductance.html

A 10 foot whip at 3.8 MHz is about 0.0386 wavelength or about 14
degrees. That's about -j4.0 on a Smith Chart. Can we say that -j1250/
Z0 =3D -j4.0? such that the Z0 characteristic impedance of the whip at
that input Z is ~312.5 ohms?

> For many years I've used a slingshot to put up antennas on Field Day. Even after just a day or two, they can sometimes be hard to get down, the twine having dug its way into the tree and gotten gummed up with sap. After those experiences, I've never been willing to put an antenna up permanently or semi-permanently by just getting a rope over a branch -- I've climbed and put a pulley part way up which I've had to replace every few years as the tree grows out over it.
>
> Of course, larger diameter rope wouldn't cut into the tree as badly as the heavy twine I use for FD. But I'm sure it would still cut in and get stuck after even a fairly short period of chafing under tension, and the tree would grow over and around the rope before long. The result would be a rope permanently stuck in the tree.
>
> So I'm curious how this ends up working for you. My trees are nearly all confers -- Douglas Fir, hemlock, sequoia. Are yours hardwood? Are other folks able to get away with this?
>
> Roy Lewallen, W7EL

Roy -

Let me tell you, I could never be good enough with a slingshot to get a line over a 120 foot tree! But the tennis ball cannon has served quite nicely for sending a line over any tree I could find. We could probably agree to disagree on this - you're good with the slingshot, and I'm an ace with the cannon.

I find that even in non-conifer trees that it's likely for a 1/4" or 3/16" rope to get stuck after a year or more. If there's a single crotch with a tight angle in it (e.g. 90 degrees) as opposed to a number of turns of smaller angles it seems more likely to get stuck. I don't see how twine could hold up for nearly that long. My installations are Dacron/polyester rope with pulleys and a counterweight; the counterweight is IMHO absolutely essential to having the antenna survive a thunderstorm.

There are also fast-growing pine trees in my neighborhood but they are "new" and not the giant old-growth trees. In the February snowstorms (4 feet of snow! Snowpocalypse!) a *lot* of the medium height pines came down under the weight of the 4 foot snowfall. Non-evergreen trees also came down but not nearly at the rate that the conifers did.

Hi,

I've noticed most homebuilt amateur antennas use tubing and usually copper,
whereas commercial antennas typically use round bar, either steel or Aluminum.

I understand the advantages of the materials in terms of electrical conductivity and weather resistance,
however I dont understand the pro's and cons of using tube vs round bar? Can you point me to

a book that may discuss this?

Have studies been done re the effect of a layer of oxidation on the
performance of the antenna?

Finally, there is plenty of material about designing antennae for a
band, but every little about designing it at a particular impedence,
can you point me to a discussion on this too?

Thanks

Steven

Hi Steven,

No book necessary. Walk into a store that sells any of this and you
will tell several things immediately:
1. what is available;

2. what is affordable;
3. which weighs more for no increase in performance.

>Have studies been done re the effect of a layer of oxidation on the
>performance of the antenna?

Oxidation is another form of insulation. Lots of antennas are
insulated. They have been studied galore. If the oxidation becomes
as thick as a vinyl jacket on your coax, then the antenna is going to
resonate at a lower frequency.

>Finally, there is plenty of material about designing antennae for a
>band, but every little about designing it at a particular impedence,
>can you point me to a discussion on this too?

Those references are too numerous to recite in one place - that is
what google is for. To the nature of your question, there is no
reliable "formula" for all styles of antenna that can provide a
satisfactory answer. Even simple antennas have complex relationships.

Electrically there is not much differance in using tubing or rods. It is mainly about the cost, weight and strength.

Copper is used by many at home because you can get it at the local stores where aluminum is often hard to come by in lots of towns. Also you can solder to copper where not many can solder or weld aluminum.

The impedance is not usually that much concern, Just design for gain and f/b ratio and then match whatever impedance you have to the transmission line you are going to use.

Copper has the advantages that copper pipe and fittings are available
at any hardware store or home improvement store. Aluminum isn't
exactly rare but it's not so easy to find in your hometown on a Sunday
afternoon at a retail store.

Copper is also easily joined with solder by just about anyone using
very simple tools. Aluminum can be welded but this requires more skill

and a welding machine.

Aluminum is a superior antenna material in terms of strength per dollar or strength per weight, but not quite as readily available.

Very few aluminum antenna designs use solid bar, with the exception of VHF/UHF or tips where the elements are so skinny that there's no point to making them hollow. The vast majority of HF aluminum antennas are not solid bar but nested sections of aluminum tubing. The ham radio magazines have lots of ads in the back from places that sell nesting aluminum tubing sections.

I don't think there is any substantial electrical difference in copper vs aluminum oxidation. Play with EZNEC varying the conductivities and you'll find that the conductivity changes are in the noise.

One important thread in these antenna designs, is not that they are numerically superior in performance to some other technique. It's that they're buildable by average hams using readily available materials.

Tim.

In the above "equivalent" is used in an interesting way. If equivalent
is used as a term of efficiency, you are absolutely correct. If you are
saying my transmitter still knows the difference between a "straight"
1/4 wave and an "equivalent loaded" antenna, the use becomes false ...
i.e., when I dip the loaded antenna with my GDO, and the antenna is
properly constructed, it tells me I have the "true" equivalent of a 1/4
wave.

Yeah. Art and "something about" some dc current/voltage and the ac current/voltage, (some dc voltage) + (some ac voltage) = peaks of ac raised to the combined potential of both is ... well, it is something, I guess ...

Mike as I understand it Aether theory started with the motion that if
two mediums meet then a electron
can pass thru both mediums OR travel between two mediums. I suppose
you can look at the Universe that way starting

and then going thru a progression of different mediums until you come
to the end or the last medium. If you put together two pieces of glass
in sandwich fashion a electron, say light, may travel thru both pieces
of glass AND/OR along the path
between the two pieces of glass.
Thus the exercise starts with Earth itself and then one determines the
next medium and so on until one reaches the outer Galaxy. Now in a
particular case scientists came across a dilemma where a path of light
existed parallel to a medium but they could not determine exactly what
the next medium was. Thus was brought forward the term Aether
as a stop gap term until the medium could be truely determined.

Visible energy/matter can occupy the same space as dark energy/matter,
much like solid salt and water can occupy the same space. Just as the
salt contributes to the mass contained in the water, visible mass
contributes to the mass occupied by dark matter.

Power will indeed be transferred through such a match. Using your antenna as an example, suppose that a transmitter with output Z of 50 ohms is connected to a tuner that transforms its output impedance to 0.6 + j1250 ohms. Connect the output of the tuner to a half wavelength 600 ohm transmission line to the antenna. The transmitter will see 50 + j0 ohms, the antenna will see an impedance of 0.6 + j1250 ohms, and full power will be transferred. Power transfer has nothing to do with the SWR on the line or the match between the line and antenna.

In practice, the line loss will increase some due to the very high SWR, but the loss increase won't be much if the matched line loss is low.

I chose a half wavelength for simplicity, but it's not necessary. Other lengths of line will transform the antenna impedance to different values. All that's necessary is to readjust the tuner accordingly to match the different impedance.

Amateurs have successfully been using this method to feed nonresonant and multi-band antennas for decades.

We could probably agree to disagree on this - you're good with the slingshot, and I'm an ace with the cannon.
>
> I find that even in non-conifer trees that it's likely for a 1/4" or 3/16" rope to get stuck after a year or more. If there's a single crotch with a tight angle in it (e.g. 90 degrees) as opposed to a number of turns of smaller angles it seems more likely to get stuck. I don't see how twine could hold up for nearly that long. My installations are Dacron/polyester rope with pulleys and a counterweight; the counterweight is IMHO absolutely essential to having the antenna survive a thunderstorm.
>
> There are also fast-growing pine trees in my neighborhood but they are "new" and not the giant old-growth trees. In the February snowstorms (4 feet of snow! Snowpocalypse!) a *lot* of the medium height pines came down under the weight of the 4 foot snowfall. Non-evergreen trees also came down but not nearly at the rate that the conifers did.
>
> Tim N3QE

I wasn't intending to argue about the best method to put a line over a tree -- I backpack my portable station as well as camping equipment on Field Day, which is why my choice of a slingshot and twine. My best height with it is about 100 feet, but I usually choose my FD sites for sloping terrain to the east so I don't need much height. My question is only about the problem of a line getting stuck after a short while. I've assumed that conifers are more of a problem because of the sticky pitch and relatively soft wood. What are the experiences others have had with moderately sized line?

Try this.

When you replace the rope, put up an extra length of rope with nothing attached to it. I have a rope over the limbs to two trees; trees are about 160 feet apart, which accommodates a 135-foot doublet fed with open-wire line.

I installed, over each tree limb, next to the ropes that hold the antenna, another rope that is simply a long loop -- goes from the ground to the limb, over the limb, and back down to the ground. There's no strain on this rope -- actually, two ropes, one over each limb where the antenna is supported. That way, if the rope holding the antenna breaks, I already have a spare rope installed -- just use it to haul up a new antenna support rope -- no need to haul out the slingshot.

The lack of comprehension of fundamental physics on this newsgroup is astounding, so it's no surprise that a less-known fact has been missed:

A superconductor has zero resistance only at DC. The resistance at RF depends, among other things, the frequency and the material's temperature. Because the resistivity of copper drops dramatically at cryogenic temperatures, it can be difficult to make a superconductor with resistance as low as copper at the same temperature.

Very small superconducting antennas have been demonstrated, but they still have a very large near field which sustains loss by coupling to nearby objects, and a large reactance which necessitates potentially lossy matching networks.

Since you are so familiar with the concept why not start from Earth
with a progression until you get to Aether. I don't think you will get
to your favorite "dark matter" For that matter explain what a "medium"
is in physics terms.

Roy,

The mention of reactance means we are talking in the frequency domain, and a steady state solution is being discussed.

Roy Lewallen <w7el@eznec.com> wrote in news:kpudnRnpGI6kj-HRnZ2dnUVZ_vqdnZ2d@giganews.com:

...
> Power will indeed be transferred through such a match. Using your

Does the use of "output impedance" here mean that he transmitter can be validly represented by a Thevenin equivalent circuit, and that "output impedance" is the Thevenin equivalent source impedance.

Without getting into that arguable postion and reinforcing the notion that a transmitter rated for a nominal 50 ohm load has a source impedance of 50+j0, you could say:

... Using your antenna as an example, suppose that a transmitter designed to operate into a load Z of 50+j0 ohms is connected to a tuner that transforms the antenna (0.5-j1250) to its preferred load impedance (50 +j0). Connect ...

> 600 ohm transmission line to the antenna. The transmitter will see 50
> + j0 ohms, the antenna will see an impedance of 0.6 + j1250 ohms, and
> full power will be transferred. Power transfer has nothing to do with

> the SWR on the line or the match between the line and antenna.
>
> In practice, the line loss will increase some due to the very high

And:

All that's necessary is to readjust the tuner accordingly to deliver the
transmitter its rated load impedance.

>
> Amateurs have successfully been using this method to feed nonresonant
> and multi-band antennas for decades.
>
> Roy Lewallen, W7EL
>

As you will have noted, some band the term 'match' around with abandon,
and it means different things in different contexts, and to different
readers.

Take a transmitter designed for a 50+j0 load, connected by an electrical
half wave of 70 ohm coax to a 50 ohm load. Is it 'matched'? Well, from
the information, it is correctly loaded, it is designed for a 50+j0 load,
and it has a 50+j0 (approximately) load. We don't actually know the
source impedance, and even if we did, it this case, whether the
transmitter is 'matched' to the line, and whether the line is 'matched'
to the load is unimportant.

'Output impedance' is another term that is used differently, some use it
to mean the equivalent source impedance, some to mean the required load,
and some insist the foregoing are naturally the same, or will be if the
transmitter is 'matched' for maximum power output.

Owen

I did. You stated:

 > Without using a loading coil, the input Z of that whip is about 0.6 -j
 > 1250 ohms. The SWR that this antenna input Z presents to unmatched 50
 > to 600 ohm transmission line ranges from 52,167:1 to 5,340:1.

In my example, the antenna is not matched to the transmission line. Nor, for that matter, is the transmitter matched to the transmission line. My point is that power transfer doesn't depend on either of these points being matched.

Art, you don't seem to understand that there is a quantum base medium
to which some other medium may or may not be added. The base medium
exists throughout all of universal space and is the only medium that
exists in otherwise empty space. Any other added medium, e.g. air or
water, is just mixed with that base medium. Please stop thinking with
a concrete brain.

Dear Group:

I add a vote for avoiding the arguable position about the "output Z" of a transmitter (note, transmitter) and instead using words similar to those used by Mr. Owen Duffy: a transmitter designed to operate into a load Z of 50+j0 ohms

Conclusions reached with a minimum of needed assumptions are preferred. Roy's observations do not require a particular output Z and are true.

A signal generator with an emitter-follower output stage having a 50 ohm resistor in series with the output port can have an output Z of very close to 50 ohms over a broad frequency range.

Concrete brain ! What are you referring to ?
Frankly I just do not understand your response.

this one sounds like a religious argument to me... to phase shift or
not to phase shift, that is the degrees of shortening... weather tis
nobler to count the degrees or accept the time delay traveling waves,
one way or another there is still high voltage at the top and high
current at the bottom, and never the twain shall meet.

instead of electrons jumping off the antenna art charges it with
magical levitating diamagnetic neutrinos that flow out from the sun
during sunspots to fly off the antenna.  that would be the same
mechanism that those other scientist dream of for affecting
radioactive decay.

From your posts here, over many subjects, I would deduce everything
here sounds religious to you. Or, as if it comes from evil spirits.
Or, it comes from an oracle sniffing the vapors of petroleum. Or, some
drug which has affected the mind ... etc.

Regards,
JS

Afternoon everyone,

I'm rebuilding my Bugcatcher antenna. It works well, but the XYL had a bit of an accident last year when we had a big snowstorm, the leaves weighted down the limbs, and the antenna, which was strapped down, still managed to introduce itself to a limb.

Anyhow, the original antenna was mounted using 1 inch thick plexiglass, with holes drilled to run the mast through, and tapped screw holes to mount to the back up plate, in turn mounted to the spare tire holder.

I'm trying to make something a little prettier now that I'm rebuilding it.

But the thing is, I'm curious about the material. Is there any particular material to avoid? I know Plexi works, but what about PVC? Delrin? Bondo? 8^) Miiling, water absorption, etc?

Polycarbonate, polycarbonate, polycarbonate.

It is way less brittle than plexiglass and far easier to machine and
work with.

It is a little more expensive than plexiglass.

Plexiglass is also know as acrylic. Polycarbonate is also known as
Lexan.

Polycarbonate is truly a wonderful material. I don't care what all
those people complaining about bisphenol-A say, polycarbonate is king.

Tim.

I have grown fond of nylon/teflon material, problem is, these materials are difficult to find locally, and are expensive when found. In a pinch, those plastic kitchen cutting boards are pressed into service here. The are an opaque material, kind of "translucent white", softer than plexiglass but hold up well under stress, will bend or warp rather than break, seem to resist UV well enough, seem to exhibit good insulation qualities up to VHF at least (highest freqs I have used them at.) They can be cheaply had at used stores. They are usually 1/2 thick. Perhaps two sheets bonded or fastened together with brass/SS hardware?

Locally findable is good. I may pick up some and try some machining
experiments. Nylon is certainly tough. Thanks, John.

My black UV resistant 'antenna rope' has been up 4 years and still feels very much like the 500' left on the spool. All is in our Gulf Coast sunlight except portions from the tree ends down from pulleys to hallard ties. Supports a G5RV 120' wire antenna. A second supports slopers for 40, 80 & 160. They stretch an inch or two between January (35') and August (96').

>
> It's held up remarkably well over those three years, but I had noticed that the rope while still fundamentally flexible was kinda "hardening".
>
> Where it went through the tree branches there was remarkably little wear over the three years. There was some black fluff where some chafing had occured but it still was holding up nicely.
>
> But I went ahead and replaced all the rope anyway. With the tennis ball cannon I actually got the new rope hung a little bit higher than the old rope.
>
> Just by touch, the new rope feels flexible and supple, and I contrast that with the old rope that isn't exactly "brittle" but does not feel nearly as flexible. The new rope felt kinda like a towel just having been washed and dried; the old rope felt kinda like a towel that had been used to mop the garage floor and then left lying there to dry. Maybe the feel was just grime and dirt that the rope had absorbed over the years?
>
> I fixed a couple of broken ladder line insulators, and inspected the plastic end insulators too. The UV-rated polycarbonate that I had used for the insulators seemed to be holding up fine, although it was no longer crystal clear and had a good amount of grime and haze on it. Certainly didn't feel "brittle" yet.

Fiberglass, fiberglass, and more fiberglass.  It bends, it can easily
be repaired with a surfboard repair kit.  It tolerates impacts better
than polycarbonate or plexiglass tubing.  It's also UV resistant (when
coated with Krylon):
<http://www.mgs4u.com/fiberglass-tube-rod.htm>
$10 for 8ft of 1" plus shipping.

>Polycarbonate is truly a wonderful material. I don't care what all
>those people complaining about bisphenol-A say, polycarbonate is king.

There's some BPA in the epoxy resins used to bond the fiberglass matt
together.  Don't drink out of your antenna, and you'll be fine.

Mike,
 I use Delrin exclusively, great machining capabilities, and excellent RF
properties, very strong with excellent wear qualities, but make sure you use
the white product ONLY. If unsure, test it in the microwave on full power
for a minute along with a cup of water, and see whether it warms.

I have used it on all antennas from HF to UHF with no problems.
Use only 316 stainless steel hardware as well, less grief later on!

Polycarbonate, polycarbonate, polycarbonate.

It is way less brittle than plexiglass and far easier to machine and work with.

It is a little more expensive than plexiglass.

Plexiglass is also know as acrylic. Polycarbonate is also known as

Lexan.

Polycarbonate is truly a wonderful material. I don't care what all those people complaining about bisphenol-A say, polycarbonate is king.

Tim.

Agree, Lexan is the way to go.
If it is good enough for the canopy of an F-16 it is just about good enough for anything.

Sam - K7SAM

Superconductors have been used as antennas where the gain has been much much more than ham antennas. It does this by removing or resisting the external magnetic field thus allowing the current flow to exit the material and travel along its surface. Thus we are able to reduce material
true resistance or losses and contribute solely to radiation.
By the same token, coils can be wound where it is totally resistive by removing reactive forces. This also means the disappearance of skin depth where the external magnetic field gains a foot hold. Thus, as

with a superconductor, we have removed the presence of resistive skin
depth resistance by allowing the current flow to exit the metallic
material and travel on its surface.
There are two resistances that must be dealt with in determining
efficiency where one is controlled by radiation that requires a equal
and opposite effect thus leaving only the metallic resistance to
concentrate upon
to increase efficiency. In both of the above cases we have been able
to divert current flow to the surface of the radiator to avoid the
intrinsic resistance of the radiating element, thus allowing all
alternating current flow to devote itself to creating radiation.

Somewhere I read not to use PVC for coil forms. Is it so ?

Having used it, I don't know why that statement would be made ... I have
heard the same about PVC grey conduit, and wonder who has tested it and
what problems they found ...

One of the most perplexing aurguements in the history of Physics is
the supposed existence of the Aether. Or in other words
Aether is has to be considered as a media.
In radio terms it can be stated that communication can be carried by a
surface wave only if it travels along the line of different media
which in physics is unshakable. Thus many physists argued that

air itself must be considered as a medium in that surface radio waves
certainly exist and thus the case against the existance of an Aether
has not yet been proven, as the question of the two mediums involved
have yet to be identified.
As I have stated earlier the expansion of the laws of static particles
show that particles from the Sun settle upon Earth's diamagnetic
surfaces. Thus providing the medium that purists have searched for
which now can replace the undeniable required presence of a medium
instead of the former "Aether". Classical physics of Newton, Einstein
and others had the answers all along with the Gaussian law of Statics!
Regards
Art

geez, all this time to think of something interesting and all you can
come up with is an outdated aether argument crossed with your magical
levitating diamagnetic neutrinos??? you could at least have tried to
latch onto this one and do something more original:

It has been proven that "empty space" is indeed not empty and consists
of quantum particles that wink in and out of existence. Aether does
exist as a sort of quantum soup, just not in the limited form that was
earlier conceived in the past before quantum physics. The Casimir
effect is a manifestation of the quantum soup that exists in "empty
space". Some physicists think that's where the dark energy is hiding.

The article is about disagreements between scientists and not
agreement, therefore nothing is conclusive. What is conclusive that
making a static field dynamic shows the presence of particles in
Maxwell's equations on radiation.If you do not have the knowledge to
refute that fact then you have at your disposal the Physics Forum
where the adjudicators are generally professors in the field who can
provide you with the answers that you cannot find out for yourself.
Intuition alone does not get the job done so go to the experts to
verify your approach to physics. Classical physics clearly state that
particles from the Sun is incorporated in the art of radiation via the
extension to the laws of Static. If you want to over rule the
professors knowledge of physics then do it directly on their forum.

Where is the beef? Where is the patent? What exactly do you think the
patent is claiming?
Is the claim legitimate? Has the ham community
agreed on the removal of an external magnetic field for maximum
efficiency? You have consistently denied over the years and now
```

miraculesly you rush to defend it. Why are you so evil? As I stated
earlier your intuitions are leading you astray in the absence of
physics teachings or classes. Go to the Physics forum and ask for the
truth.

Well, "ether particles" would certainly be one suitable explanation ...
and, I must say, the word aether is growing on me, you suppose it is the
way art pronounces it? <grin>

Whoa!You are talking apples and oranges. The two mediums discussed is
in actuality mass and particles where as it was considered as mass and
the Aether. I am certainly aware of the term quantum soup outside of
the Earths confines!
The two mediums of a radiator and particles is what provides for
ground wave and connected to
propagation. I don't think the scientists of the day were considering

propagation in outer space but I am willing to read any article that
supports your position
There are many positions and counter positions on the subject given by
most of the masters of the day.
Art

Oh Art, this can be very taxing, but there is gravity, the method of the
propagation of emf, and then there is dark matter, as Cecil threw in ...
these are some of the last frontiers where discoveries will be finally
be found.

I interpret Einsteins remarks on ether to be an admission that his theory of gravity would become undefined, if not for the "gravitational ether", not his exact words--his theory involving gravity depends up an ether. An ether composed of quantum particles would begin a solid discovery of how rf/light can behave both as particles and as waves. Gravity affects and can bend radio waves, obviously radio waves should have some effect on gravity, at sufficient energy levels. Dark mass appears to have an effect on gravity ... so in there is also a suggestion that these all have some profound form of relationship ... and it is here that "guesses", predictions, statements of bizarre magnitude and theories can abound ... I believe I can see your house, where you reside, down the street, just over there ... glad to see ya' still kickin', as long as you ain't breathing dirt, it is a good day.

Regards,
JS

> The insulation properties of rigid PVC are satisfactory and those of plasticised PVC are poor. The values, which are only mediocre in any case, are impaired still further by the plasticisers. As a result of the high dissipation factor, PVC is not suitable for high frequency applications.

PVC has a dissipation factor of about 0.0350 compared to about 0.00610 for Polycarbonate.
<http://www.matweb.com>

Black PVC is also loaded with a small amount of carbon pigment, which likes to get warm/hot/melt when RF is applied.

PVC is also subject to dielectric absorption. Build a capacitor out of two plates with some PVC in between. Apply some DC, remove the power source, and short the plates for 2 seconds. Then measure the residual voltage across the plates. PVC and vinyl are awful. Teflon, polystyrene, and polypropylene don't have this problem.

you should really talk with mr.b... he likes those old time scientists
and the stuff they wrote before all the real experiments disproved
aether and magnetic vortices and all that other stuff that you seem to
love. please write something new and funny about the magical
levitating diamagnetic neutrinos that explain how my ferromagnetic
antenna radiates.

I finally got around to read that patent you were referring to. It
involves the increase in radiation that can be achieved by
superconductors in temperatures way below that seen by humans.
for hams and industry using this knowledge by far the biggest expense
is the extreme cooling equipment that is required as evidenced by MRI
```

costs which is more than the most avid ham could afford. There is no doubt that the repelling of external magnetic fields removes the formation of resistive skin depth of these ultra cool materials.

I advocate the use of the Meissner effect with antennas that does not require the extensive cooling costs equipment required by superconductors to remove the presence of the resistive skin effect that superconductors have shown is very advantageous when designing antennas. These are differences in both of these methods in removing the unnecessary losses of magnetic field generation but the commonality between them is the increased efficiency in radiation. A side issue is that the idea of smaller radiators is a reality as the idea of radiators must be straight is totally false. The bottom line being that every inch of current flow produces radiation whether we like it or not and cannot be suppressed.

Tom, you should avoid trying to give the impression that you are skilled in physics. You are not an engineer and you only work under a engineers supervision because of your lack of knowledge.

Every time you put pen to paper it is painfully evident that you are
totally lacking in the subject of physics. A ferromagnetic antenna
will certainly radiate but it totally swamps the Meissner effect
common with diamagnetic materials. They certainly do not duplicate in
actions with respect to radiation.
Most hams build their antennas with diamagnetic materials like copper
and aluminum as they do not portray the hysteresis effect common with
ferromagnetic materials. As for diamagnetic materials that demonstrate
levitation you can buy these on E bay or at Edmonds scientific if you

```
have any doubts about their authenticity.

but of course you can't radiate without generating a magnetic field
and any current produces a magnetic field so everything you are saying
is junk.

but how can it radiate if it doesn't have your magical diamagnetic neutrinos to levitate??   oh and to bring in one of mr. b's favorites, how do diamagnetic neutrinos accumulate on copper wire antennas if they are insulated... i'm sure he will love to hear your answer. he thinks electrons jump off the antenna and require a dc source to keep the antenna charged, you would love to chat with him!

Read, read again, then read again. The magnetic field referred to is
the EXTERNAL magnetic field.
A superconductor REJECTS any EXTERNAL magnetic field. With respect to
a "double helix" one can prevent the external magnetic field by
ensuring that the helix is resistive at all points along its length.
This results in a constant current along its length regardless of

frequency applied.
When amateurs in ham radio cling to the idea that radiators should be
straight they are advocating the generation of external magnetic
fields which only provides losses and less radiation. This is a spill
over from the old idea that waves produce
propagation instead of particles which is resisted
by the older generation who are adverse to change.
Tom you should not adopt the mantle which you have not earned as you
only are cheating yourself.
To others skilled in the art you are painfully transparent.

```

A long time ago there was a arguement both on this group and on E ham
with respect to the function of a coil with respect to replacing
missing degrees of a wavelength.
Both Tom W8ji and Roy W7EL did experiments which apparently justified
an account written up by Tom under the subject.
You should look it up and read it.
Tom states that the double helix is totally resistive and antenna
elements should be straight reffering to spacial distance.,
He then came to the astonishing conclusion that for maximum efficiency
radiators should be straight and for some reason dismissed the double
helix to give strength to his claim that radiators must be straight
which is fraudulent. A straight radiator generates a external magnetic
field which introduces losses whereas the double helix supplies all

applied current to the generation of radiation. None of the experts on
either group challenged challenged the statement allegedly supported
by both Tom and Roy
and it still remains in print to this day

I continued on reading Toms many dissertations on radiation and
antennas when I came across a lecture he gave at Dayton regarding
small antennas. Again he pushed his personal intuition with respect to
small antennas and spacial distance
and received no rebuttals from the audience or the ARRL . In addition
he always spouts his pet sentence on radiation is by the acceleration
of charge but never states what the charge carrier is
as he is still wedded to the idea of wave carriers which has no
justification what so ever. We desperately need the help from physics
majors to challenge the spread of old wives tales that are propagated
without technical justification and sucked in by the new generation of
which the hobby is now created or we lose the credibility obtained by
hams who foraged before us with respect to the state of the art.

I have an old alanice antenna rotor that was given to me. I have a question the rotor has 5 wires but the control box has 4 connections how do i wire up the rotor to the box? The rotor might be a old 100 or 200 u rotor. thanks for any help Robert

actually, probably none of my antennas are perfectly straight, all the
yagi elements droop under their own weight. inverted V's follow a
curved path and are of course not colinear, and in most cases not even
in a plane. inverted L's aren't straight. my ferromagnetic radiators
are probably the closest ones to straight, except for the one that was
dropped on the way down one time and is a nice curved shape.

and you are wrong about superconductors rejecting external fields,
they reject INTERNAL fields. you can have any field you want outside
a superconductor. and double helixes are biological not
electromagnetic, go take another basic calculus course if you think
'curl' is describing a vortex or helix.

so?  many incorrect things are in print, do you believe all of them?
i think your double helixes are missing a few turns here and there.

You need to get a different control box. What you have is not compatible. For example a T-20 rotor used a 4 wire connection and a T-45 used a 5 wire.

I am completely ignorant of your "double helix" so I cannot comment on that subject. I always thought a double helix was a strand of DNA.

On the subject of the number of degrees occupied by a loading coil, both Tom and Roy made an incorrect assumption that rendered their conclusions at best moot, and at worst false. Roy reported no measurable phase shift in the current through a loading coil and seemed to support the misconception that the phase shift is proportional to the delay through the coil, which it is not.

Both Tom and Roy seemed to assume that the antenna current changes phase by one electrical degree for each physical degree of antenna. But EZNEC easily proves that to be an incorrect assumption for the current in a standing-wave antenna which includes dipoles, monopoles, and loaded mobile antennas. The following applies to 1/2WL dipoles and 1/4WL monopoles including loaded mobile antennas.

THE PHASE OF THE NET CURRENT IN A STANDING-WAVE ANTENNA CHANGES VERY LITTLE BETWEEN THE FEEDPOINT AND THE TIP END OF THE ANTENNA.

The phase of that current cannot be used to calculate the delay through a wire or through a loading coil. The phase of the net current in a thin-wire 1/4WL monopole changes by ~3 degrees over a 90 degree physical length. The same is true for a loaded mobile antenna. Anyone assuming that signal delay is proportional to current phase shift in a standing wave antenna is off by a magnitude or more. Tom's reported 3 ns delay through his coil is about 12% of the actual value of the delay at 4MHz.

The following inductance calculator can be used to estimate the delay through a loading coil. The parameter to use is the "Beta =3D rad/m, Axial propagation factor of n=3D0 sheath helix waveguide mode at design frequency[1,8]'

http://hamwaves.com/antennas/inductance.html

The rad/m of the axial propagation factor can be used to calculate the number of degrees occupied by the specified loading coil and the velocity factor of the loading coil. The 100T, 10" coil that Tom used for his "measurements" has a delay of ~30 degrees at 4 MHz, virtually unrelated to the phase-shift in the standing-wave current that he reported. Delay is NOT proportional to current phase-shift on a standing-wave antenna and certainly not for the loading coils on a

standing wave antenna. However, delay is proportional to current phase-shift on a traveling-wave antenna.

> Whoa!You are talking apples and oranges.

Of course, but apples and oranges are both particles. The old masters were correct about the aether consisting of particles - they were just wrong about the nature of the particles.

If someone hits you in the head with a frozen apple or a frozen orange in the dark on a winter night, it is difficult to tell the difference. Quantum physics has turned on the light.

Here's a quote from "Fields and Waves ...", by Ramo and Whinnery:

"A perfect conductor is usually understood to be a material in which there is no electric field at any frequency. Maxwell's equations ensure that there is then also no time-varying magnetic field in the perfect conductor."

Yes, the free, as in free beer is one great advantage, but an advantage not all will be able to take advantage of. Since MMANA-GAL and EZNEC have visual interfaces so similar, being able to use one is effectively being able to immediately use the other. The learning curve into your interface takes just a bit longer ... but, as you say, the availability of the source makes it highly desirable to at least one group.

Thanks for the swift reply,

JS

Antenna Newsgroup Denizens:

Apart from the professional 'lab grade' (and undoubtedly very expensive) devices made by the likes of Agilent, there are on the amateur market several antenna analyzers that are more reasonably priced.

I'm currently considering the purchase of such a device, and so...

I'm interested in hearing opinions, pro-con arguments, and/or receiving pointers to reviews of such devices.

All thoughts and comments will be appreciated, unbiased or not.

Thanks!

I have only one comment which applies to most if not all of the amateur level products, as well as a very high quality HP impedance meter I used years ago.

I live about 15 miles from hilltops where the local AM, FM, and TV broadcast towers are. The signals from those stations are strong enough to overwhelm the broad bandwidth detection circuitry in the analyzers (and HP vector impedance meter) I've used, resulting in meaningless readings when connected to an antenna. I find that I grab my MFJ antenna analyzer for a host of jobs like measuring a ferrite core impedance,

checking the length of a piece of coax, and so forth. But for me it's
just about useless for the job of analyzing actual antennas. When I need
to measure antenna impedance I dust off an old GR bridge and use a
portable receiver for the detector in order to reject the strong ambient
signals.

Of course this isn't a problem for everyone, but it sure is for me and I
don't think my situation is unusual for an urban environment. I've had
to put common mode chokes on my thermometer thermocouple wire, my light
meter connecting wire, scope leads, and even in audio circuitry to keep
the RF out. But even one strong local station might be enough to upset a
typical antenna analyzer.

I've used Autek Research "RF" and "VHF" Analysts for some time and they've served my purposes for antennas and testing.

Also Heathkit, Diamond (VHF-UHF) and Daiwa power output & SWR meters in-line on coax.

Not so important if one uses a Tansmatch or tuner with them built-in.

Roy:

Thanks for your input on the effects of interference from other transmitters, especially BC transmitters, point well taken.

I suppose one might add some kind of carefully designed passive filtering to the devices to 'notch' out offending BC stations, etc...

But... that would be messy and complicated.

Using a bridge with a tuned detector seems a much better approach. I do have an old MFJ Rx resistance bridge at hand, but I was looking for a little bit better accuracy. I must check e-bay, etc... for prices for a used bridge of the GR class you have.

My current problem could likly be solved by using one of my (so-called) VSWR meters, but I felt I might like to get a little more metrological capability for a few bucks.

I've never had a vertical antenna before and currently I'm laying out a radial field under a new vertical antenna. I just wanted to know when to stop laying down radials.

I figure that I just need to measure the input impedance of the antenna Zin at my frequencies of interest and record the (hopefully decreasing) impedance values as I lay down more radials. My assumption is that Zin = Zant + Rg. where Zant includes the reactance and radiation resistance of the radiator element at my frequency of interest and Rg is the ground resistance. Hopefully Rg should decrease as I add raials. I intend to quit adding radials when the impedance decrease becomes 'negligible' (In the sense of received S units [smile]).

Thanks again!

i presently have 3 analyzers... an mfj269 which i use for taking up towers to check antennas when i have doubt about the coax or switch, checking tuning real quick on anything, and doing simple cable loss checks. then i have a minivna which i am still learning to use, but which has proved very helpful in tuning stubs and checking filters. it also does the tuning checks from the shack but requires a pc for operation so wouldn't be very useful up a tower. my third one is a home made tdr, just a decent scope and pulse generator set up to do tdr on cables from the shack end. indispensable for finding damaged cables, isolating bad connectors or relay boxes, etc. i wouldn't want to be without any of them right now.

Yes, it is. I've done it, but a lot of care has to be taken that the 
filter doesn't have a significant effect on the impedance being 
measured. At best, it usually also restricts you to a relatively narrow 
bandwidth. It might be adequate for your particular purpose, however. 
But for the job you describe of evaluating a radial system, a simple 
homebrew resistance bridge is perfectly adequate. _Solid State Design 
for the Radio Amateur_ had some examples, and I assume its successor 
_Experimental Methods in RF Design_ does also.

Antennex.com is, perhaps, the largest and most diverse website devoted
exclusively to antennas and related items. The website has both free (no
charge) and fee (charge for subscription) sections.

The user group is no charge and there are particiapnts from close to 100
countries with skill levels from enthusiastic amateur to world recognized
experts.

If you're saying free isn't really free I can agree with you. I have
brewed my own beer (still do) and the realization was quickly
discovered that free isn't really free unless the hourly rate is zip,
zero, nada....

Paying consultants a kilobuck per day to support FOSS-based projects
starts looking pound-foolish very quickly. Training the in-house guy
to learn the ins and outs of a piece of FOSS doesn't work too well
either. If the guy is any good, he will soon be marketing his skills
as a $100+/hr consultant. In this aspect FOSS is just another form
vendor lock-in except the vendor is the consultant hawking his skills
and knowledge.

>Since MMANA-GAL and EZNEC
>have visual interfaces so similar, being able to use one is effectively
>being able to immediately use the other.  The learning curve into your
>interface takes just a bit longer ...

Both provide immediate understanding but one immediacy takes longer
than the other? How different are skillsets for using a WIMP
interface?

>but, as you say, the availability
>of the source makes it highly desirable to at least one group.
```

>
The free in FOSS doesn't mean that anything is free of a learning curve. In fact FOSS can actually present a learning wall. P2P support tends to deal with solving specific problems rather than any abstract interpretation of what the problem is, why it exists (aka why the tool works as it does), and how best to resolve the specific issue.

The biggest problem with FOSS is too many freetards try to use the tools and fail to contribute what they have learned/experienced into any sort of public knowledge base.

I don't mean to denigrate FOSS at all. I'm just asking if FOSS is _the_ answer what was _the_ question? Too many know-nothings assume the tool is the answer and free means minimal effort/expense required. Only knowledgeable consumers ask how expensive is free.

Hi Pete, If you are evaluating a radial field for a vertical, then the value you should be shooting for is 30-35 ohms, with no reactance. As you know this is 1/2 the impedance of a 1/2 wave dipole-70 ohms in free space. I have never done this, but an impedance below 40 ohms with little reactance should provide you with an efficient vertical. Once you get around this value, I guess there is nothing to be gained by adding more radials. What your analyzer tells you, as others have mentioned, depends on the rf in the area.

Well, as you have seen, a concept such as "free" can mean many things to many different people, splitting hairs on that is only a waste of time some can engage in here ... However, I have downloaded the source, in C++, and have been making notes and stub testing various parts. One aspect of the source which really strikes me in the face, it is un-commented! Ya' just gotta luv that software engineer! ROFLOL

Regards,
JS

The actual value you get when the radial system loss is minimal depends on a number of factors, including the height and diameter of the vertical. I've also seen convergence to other resistance values when the ground was dry on the surface but apparently wet at some depth below. In that case, radial current can be significant at quite a distance from the antenna (as opposed to the exponential-looking decay you see in the current on radials buried in moist ground), making the system act more like a system of elevated radials. In those systems, radial length also plays a role in determining the feedpoint resistance value.

The bottom line is that I don't trust a single value or its comparison to 36 or 40 ohms as being a reliable indication of efficiency. You either need to look for convergence of the feedpoint resistance as Peter proposed, or even better yet, look for convergence of field strength values at a fixed location as you increase the number of radials.

Hi Pete, long time since I've seen a post from you on this NG!

Pete, I'd take Roy's route and use a GR impedance bridge. I've used the GR-1606A and the 1606B for the last 50 years. If you're not familiar with it it's been the standard impedance-measuring device for AM BC antennas for more than 50 years. It's accuracy cannot be beaten. These bridges were expensive when new, but they are available rather inexpensively now, and are stable as a rock. And as Roy said, they use either a millivolt meter or a tunable receiver as the detector. Using the receiver, interfering signals picked up with the antenna being measured are eliminated, thus not degrading the accuracy of the impedance measurement.

The GR-1606A measures from below 500 kHz up to 60 MHz. The GR-1602 measures well into the VHF range. If you should try one I know you'll like it.

Walt, W2DU

PS--If you'd like to see the results of measuring W2DU's antenna impedances, I refer you to Reflections, Chapter 15, Tables 15-4, 15-5, and Fig 15-1, which is a graph of the data in the Tables. If you don't have a copy of Reflections you can see this data on my web page at www.w2du.com. Just select 'Read Chapters from Reflections 2'.

I've been pretty satisfied with the AIM 4170. Check this out.

http://arraysolutions.com/images/Tuning_160m_Vertical.pdf

Please, note that I experimentally confirmed -once again- that NASA does not infinitely support direct linking to its Technical Reports Server (NTRS) contents. Therefore, the link given in article:

```
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
| Sent......: Thursday, August 19, 2010 7:32 PM
| Newsgroups: sci.physics.electromag,rec.radio.amateur.antenna
| Subject...: Re: vemsa3d 1.1 - a floss visual em simulator for
|             3d antennas

|
| ...
| J. H. Richmond, Radiation and Scattering by Thin-Wire
| Structures in the Complex Frequency Domain, (15), p.6
| http://tinyurl.com/24zwycy
| ...
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
```

is not a valid one anymore. One has to firstly connect to NTRS:
http://ntrs.nasa.gov/search.jsp

and search for:
"Radiation and scattering by thin-wire structures in the complex frequency domain"

or some adequate part of it, e.g. like the following one, which it seems that currently holds:

"Radiation and scattering by thin-wire"

to get the Richmond's report item first and after two
more steps the full-text through "View PDF File".

Petros Zimourtopoulos

Dear JS,

Thank you for pointed out this issue too!

As I already said, VEMSA3D is open source code, which is
distributed as free-libre; not free-gratis. Therefore, we
keep the right to publish full-comments about our source
code sometime in the future, as everybody else of course.
Please, see GNU GPL 3.0:
http://www.gnu.org/licenses/gpl.html

Free-gratis is the MS Windows application VEMSA3D, which
everyone can enjoy the production of it by simply following
the fully-commented instructions we already gave at the third
page, right column, of our paper:
http://arxiv.org/abs/1006.0031

Best regards,

pez, SV7BAX

|
| FYI I'll be posting information and links on your software on
| antenneX.com's user group.
|
| Antennex.com is, perhaps, the largest and most diverse
| website devoted exclusively to antennas and related items.
| The website has both free (no charge) and fee (charge for
| subscription) sections.
|
| The user group is no charge and there are particiapnts from
| close to 100 countries with skill levels from enthusiastic
| amateur to world recognized experts.
|
| Bill
|
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -

  Thank you very much, Bill, I really appreciate your offer.
  Please try to do so -if you are an unmoderated user of the
  magazine list, of course- since our accounts to magazine
  e-list are about to expire, while, after 7 years or so, our
  group members' subscriptions to the magazine, have been
  recently expired -the last one today:

Hi, there are quite many choices between tiny hand-held units like Autek Research VA-1 vector analyzer and computer/laptop connected VNAs like N2PK VNA which gives more accurate measurements. This last one is basically a kit, but not too complicated to build at home and is quite multi-use device.
Both have been useful and done their jobs well.

[snip]

That's exactly what I thought.

Since; (a) I don't know my soil characteristics and (b) because of property limitations that dictate a non-uniform radial field, I felt that all I can do is to lay down radials in the property area I have avaliable until I see the change in Zin due to adding more radials become insignificant, then... I'm done!

I don't really care what the exact value of Zin = Rin + jXin ends up to be, since there is nothing I can do about it anyway. When I reach the point in laying down radials to where I can't reduce Zin much by adding more radials, I will then have the most efficient radial field with the lowest ground resistance Rg that I can get for my money and effort [smile].

Heh, heh... Money is only money, the effort, hmmm... well that's me crawling on my hands and knees for hours digging in the dirt (sand) in the blazing hot Florida sunshine, heat and humidity!

When I arrive at that point in burying radials, I believe that I can then tune out any reactive part of Zin with my 'tuner' and and end up feeding power into the remaining resistance Rin which then should be the sum of the vertical element radiation resistance Rr and whatever value I have ended up with for ground resistance Rg.

I just won't know what the value of Rr and Rg is, but I will know that I have achieved the most efficient radial field I could put down here at my place.

Is this right?

-- Indialantic By-the-Sea, FL

PS: I took your advice and did some reading on simple impedance bridges, and I saw one that you had designed in one of my ARRL pubs. Cool!

Another idea I came upon that allow the use of those antenna analyzers in a situation where they can be somewhat immune to BC interference involved a two step process that went as follows...

(1) Hook up a transmitter through an antenna tuner to the antenna and ground systems under test and tune the tuner for zero reflected power with a 50 Ohm reflectometer (VSWR meter). Then (2) disconnect the tuner from the antenna, and without disturbing the tuner settings, hook a 50 Ohm load to the input side where the transmitter was connected, and then use the antenna analyzer to measure the impedance looking back into the output, or antenna terminals, of the tuner. This impedance should be the conjugate of Zin. Here the

analyzer may not be as affected by potentially strong BC RF signals picked
up by the lengthy antenna element.

Hi Pete, long time since I've seen a post from you on this NG!

Pete, I'd take Roy's route and use a GR impedance bridge. I've used the GR-1606A and the 1606B for the last 50 years. If you're not familiar with it it's been the standard impedance-measuring device for AM BC antennas for more than 50 years. It's accuracy cannot be beaten. These bridges were expensive when new, but they are available rather inexpensively now, and are stable as a rock. And as Roy said, they use either a millivolt meter or a tunable receiver as the detector. Using the receiver, interfering signals picked up with the antenna being measured are eliminated, thus not degrading the accuracy of the impedance measurement.

The GR-1606A measures from below 500 kHz up to 60 MHz. The GR-1602 measures well into the VHF range. If you should try one I know you'll like it.

Walt, W2DU

PS--If you'd like to see the results of measuring W2DU's antenna impedances, I refer you to Reflections, Chapter 15, Tables 15-4, 15-5, and Fig 15-1, which is a graph of the data in the Tables. If you don't have a copy of Reflections you can see this data on my web page at www.w2du.com. Just select 'Read Chapters from Reflections 2'.

Danny:

Hey thanks! I read your reference. Nice piece of work!

I guess I didn 't realize just how big those BC RF signals on the antenna element would actually be.
And for that matter, how little front end selectivity the analog inputs of those amateur antenna analyzers contain. None!

Hmmm... the amateur antenna analyzer sales literature I read don't mention this problem at all. The ads all 'brag' on the 'super features' of the devices. [smile]

I presume there must be more than a few dissappointed antenna analyzer purchasers who find this fact out the hard way.

Thanks again for the great reference.

Hi Pete, If you are evaluating a radial field for a vertical, then
the value you should be shooting for is 30-35 ohms, with no
reactance. As you know this is 1/2 the impedance of a 1/2 wave
dipole-70 ohms in free space. I have never done this, but an
impedance below 40 ohms with little reactance should provide you with
an efficient vertical. Once you get around this value, I guess there
is nothing to be gained by adding more radials. What your analyzer
tells you, as others have mentioned, depends on the rf in the area.

Gary N4AST

My experience with the MFJ-269 agrees with Roy's -- fine for bench top
measurements but nearly useless for antenna checks if you're close to
high-powered broadcasters. (I'm even closer than he is!)

I have been thinking of an antenna impedance measurement setup using a
HF bridge of some kind, driven by a high-level generator to swamp out
the ambient junk. My 100 wattHF rig followed by a power attenuator
(say, 10db?) would serve to drive the bridge, I would guess.

Anybody have some thoughts on this approach - pro or con? What kind of
bridge would be good?

Larry Coyle, K1QW

Petros ...

I posted some information on your VEMSA3D on Antennex's discussion group, but your email bounced. May I have a correct email for you, please? PM me if you'd like.

Again, I would never look a gift horse in the mouth ... I don't find the lack of comments an surmountable problem. If you have a basic understanding of the concepts which a piece of software source deals with, it is relatively easy to locate them and comment/document them yourself. For example, when looking in software for routines and statements dealing with a circle, you would simple search for constructs dealing with area, circumference, diameter, etc. It is just a logical progression to look for those dealing with the implementation of the moment method. NEC source used in conjunction with these efforts makes it a tolerable exercise in reverse engineering the task ...

I see nothing wrong with expecting someone to do a bit of work to get something for "free", LOL.

Regards,
JS

You could just pass the coax though a suitable toroid. This toroid having a few turns of wire, rectification (diode) and some type of readout. This could easily be slid along the length of the coax and "relative measurements" taken. You could probably add some calculations and with the proper choice of components, actually get "real" readings.
  A simple turn of non-shorted coax around the inside circumference of the toroid, plus windings, would provide a measure of capacitance decoupling. I am sure, someone, somewhere has already done this and would have some meaningful data what is possible or what might be expected ... if nothing else, a "poor mans' indicator."

Hi Roy, I agree that field strength would be the best indicator of
efficiency as additional radials are laid down. However, for the
average Joe Ham trying to figure out how many radials is enough, and
all he has is an antenna anlyzer, what do you recommend?

Seems to me, with a 1/4 wave vertical of diameter large enough to
minimize I^2*R losses over average ground, if you add enough radials
to get the impedance to 35+/-j0 ohms as measured by the antenna
analyzer, you should be good to go. An additional check with the
analyzer could be the SWR bandwidth. If the swr was 1.7 across a
broad range then the 35 ohms is all ground losses. If the 1.7 swr
bandwidth is very narrow then you have a high Q antenna, and very
efficient at the operating frequency. Does this make sense?

Gary N4AST

Bill,

Yes, indeed! I just saw your appreciative message for vemsa3d
along with the comments of other [Antenna-discussion] list
members, just a little before, when I unsubscribed from that
list:

-
| Sent...: Wednesday, August 25, 2010 8:43 AM
| Subject: You have been unsubscribed from the Antenna-discussion
| : mailing list

| Again, I would never look a gift horse in the mouth ... I don't
| find the lack of comments an surmountable problem. If you have
| a basic understanding of the concepts which a piece of software
| source deals with, it is relatively easy to locate them and
| comment/document them yourself. For example, when looking in
| software for routines and statements dealing with a circle, you
| would simple search for constructs dealing with area,
| circumference, diameter, etc. It is just a logical progression
| to look for those dealing with the implementation of the
| moment method. NEC source used in conjunction with these
| efforts makes it a tolerable exercise in reverse engineering
| the task ...
|
| I see nothing wrong with expecting someone to do a bit of work
| to get something for "free", LOL.
|
| Regards,
| JS

- -

That's right! Since -as you already said- there are various
aspects of "free". Therefore, there is no field of application
of term 'reverse engineering' especially under the licenses
'Free Libre Source Code' and 'Public Domain Source Code',
since there is nothing there to disassembly it.

Moreover, under these licenses, ethics impose to give in return
at least as much as you get. This is especially holds in VEMSA3D
case, in which we get the Source Code included in J.H.Richmond's
report:

"Computer program for thin-wire structures in a homogeneous
conducting medium"

or just

"Computer program for thin-wire structures"

from NASA Technical Reports Server at:
http://ntrs.nasa.gov/search.jsp

in the way already described in message:

| Sent......: Tuesday, August 24, 2010 8:59 AM
| Subject...: Re: vemsa3d 1.1 - a floss visual em simulator
| : for 3d antennas

| Newsgroups: sci.physics.electromag,rec.radio.amateur.antenna
| From......: <pez@grnet.gr>

Well, this source code has 1,044 lines of code, in 16 routines:

```
 (1,044 = 100 + 61 + 158 + 36 +  9 + 98 + 120 + 104 + 40 + 64 +
       +  45 + 22 +  22 + 40 + 87 + 38)
```

and in return, we give for now:

* only 3 comment lines less than *

those exist among these 1,044 lines -as one can easily find
them in SGANT routine, at page 22, of the aforementioned
report.

Best regards,

pez, SV7BAX

It's a matter of how much you want to pay. If you want highly selective
over the frequency range we generally use, you have to be prepared to
pay and pay well.

> Hmmm... the amateur antenna analyzer sales literature I read don't
> mention this problem at all. The ads all 'brag' on the 'super features'

Could be. As for Amateur use, there are lots of options. There's even a
bare bones MFJ SWR tester that will be fine for 90 percent of what most
of us want to do. Most amateurs just want a low SWR so their rigs don't
fold back on power - for good or bad, that is the case.

Yes. Well, "reverse engineering", apparently, has many different
meanings to many different people, as "free", also. However, all
reverse engineering, done by engineers, does not involve a disassembler.
Physical devices and concepts lend themselves well to reverse
engineering, also.

I certainly have no interests in implementing any of this in a

business/financial interest. And, since amateur radio itself demands the
concept of "giving back"; It is a well known tradition. I see no
conflicts with my directions, uses and interests.

NASA's contribution has already been paid for. NASA is the beneficiary
of public funds ... I am sure the taxpayers say, "Thank you NASA;" I
know I do.

I am sure you are already familiar with this, but never hurts to review
when working with baluns/ununs:

"The maximum attenuation of a ferrite core is not where the inductance
is maximum, but instead is where the magnitude of the impedance is
maximum. This impedance peak may even be where the impedance has no
inductive component nor capacitive component i.e. at resonance.

The frequencies that you are trying to attenuate determine the core that
you should use."

One mans' experience and experiments here:

As others have noted, it really is almost a case of you get what you pay for with antenna analyzers. Lesser models are prone to interference especially around high power installations and will give you only pieces of information you may need. One of my personal favorites is the TE-1000 'impedance analyzer' (http://www.lbagroup.com/technology/te1000-impedance-analyzer.php) made by TOMCO which measures pretty much everything you could hope for and has a high amount of protection from interference. I know several AM and even television broadcast guys that use this around towers without issues.

I would think that using the link by the the handle will remain fixed:
http://hdl.handle.net/2060/19740013743

but it's always useful to keep track of the NASA document number (that won't change).. NASA-CR-2396 or TR-2902-10 and hopefully you can always search on that, if the handle dies for some reason.

You've got two basic approaches to dealing with strong interference:
1) Make the signal you're measuring huge, so the interference is small..
any detector works
2) Use a tuned narrow band detector.

I would think you could use a simple resistive bridge with option #1, although the tricky part is getting phase measurements. The current crop of PC based VNAs and the like rely on having a handy quadradure source. You could probably use a TAPR VNA, with a linear amplifier on the Tx port and pads on the Rx port, after calibrating out the amp/pads.

A narrow band detector would be easier. This is sort of how the "noise bridge" schemes work.. they use your HF receiver as the narrow band detector. Again, almost any bridge would work for scalar (non-phase) measurements.

Another approach is the old "three voltmeter meter" technique, which is essentially a broadband detector and half a bridge, and lends itself to high power.

The real challenge isn't in making the measurement, but in automating it so that you can do a "sweep" conveniently. For spot measurements, almost anything works well enough, but if you want to make 100 measurements it gets real tedious.

Thank you very much to correct me on this issue!

I did know the DocID existence but I did not realise,
until now, how it can be proved helpful. From the URL
you gave us for Richmond's report:

| http://hdl.handle.net/2060/19740013743

I found that 'hdl.handle.net' is a 'Handle Server', and
from NTRS item for this paper, I see that 19740013743 is
its DocID. In this way, and by experimentally replacing
this DOcID with '19890004330', I got the report titled
"Radiation and scattering ...". May now I think that
'2060' is some kind of ID in this Handle System for NTRS?
Where can I find more such IDs? Would you please advise me
more on this interesting subject?

Hi

Probably my comments are bit late... but OWA yagi's use direct feed to
driven element with a ferrite balun near the feedpoint.
OWA's give good impedance match in large bandwidth, this is based on
nearer driven element-first director spacing.
Otherwise gain, F/B etc. are very good.

I have constructed one 6m OWA yagi, with 20 ft boom as it was available,
using 7 elements in it, and finally with good match below
S 1.2 between 50...51 MHz.
Nothing critical in it, element dimensions were taken from NW3Z & WA3FET
article in OWA yagis, their 21MHz desing was re-scaled to 50MHz.
At least waterproofing is less critical in direct feed.

73's Kari

Actually, my MFJ catalog page for their antenna analyzers shows an
accessory, the mfj-731 "tunable analyzer filter." It's made for
operating an antenna analyzer in "presence of strong rf fields."

Personally, I have no experience with the filter -- my mfj-269 seems
to work okay, even with a 50-kw KTSA about a mile and a half away on
550 khz.

>> I see all kinds of crazy matching sections in posts about 6 meter
>> beams. How about direct connect.

Direct connect is used in a number of tribanders, but AFAIK it's not
used in larger than 3L beams due to the low impedance. It can also
distort the pattern, but with a 3L I doubt you'd notice. Just put 3
or 4 2.4", #32 mix toroids with 4 or 5 turns of feed line through
them. It'll give the isolation and balance needed as long as the
impedance at the feed point is correct.

>> I have an A4S that has major issues
>> in the traps and I cant find the problem (IE I opened them and cant

Problems in traps can be difficult to find. I had an ATB34 that
appeared to have a trap problem but it turned out to be the feed line
to driven element connection. They use 1/4-20 SS bolts through the
insulators. The bolts simply press on the element inside the
insulator. One was making a poor connection even though it felt
tight. Taking it apart and cleaning the ends of the bolts and
polishing the ends of the driven element where the bolts rested fixed
it even though I could see nothing wrong at the time.

>> find anything) SOOO I have a new A4S coming.
>>

Spacing is generally far more than a little too wide.

>>
>> Would a 4 elem be better since its a long boom ?

Long boom? Tribanders come in a wide variety of lengths. If it's the
typical 19 or 20', you are probably looking at around 5 elements.

Use one of the modeling programs, or get some to run it for you.

>>
>> I'm pretty sure I know the answers. Just want to confirm and see if

There's really nothing particularly complicated about a hairpin or
gamma match. There are probably lots of designs that could be copied.

Water proofing the coax is very important, particularly when you get
to 50 MHz.

| Thank you very much to correct me on this issue!
|
| I did know the DocID existence but I did not realise,
| until now, how it can be proved helpful. From the URL
| you gave us for Richmond's report:
|
|| http://hdl.handle.net/2060/19740013743
|
| I found that 'hdl.handle.net' is a 'Handle Server', and
| from NTRS item for this paper, I see that 19740013743 is
| its DocID. In this way, and by experimentally replacing
| this DOcID with '19890004330', I got the report titled
| "Radiation and scattering ...". May now I think that
| '2060' is some kind of ID in this Handle System for NTRS?
| Where can I find more such IDs? Would you please advise me
| more on this interesting subject?

It seems that this is a somehow complicated matter...

Well, there is a basic FAQ here:
http://www.handle.net/faq.html
http://www.handle.net/overviews/handle-syntax.html

where I found that in the referenced by Jim Lux:

| http://hdl.handle.net/2060/19740013743

or in:

http://dx.doi.org/2060/19740013743

the couple of numbers '2060/19740013743' forms indeed
a unique 'handle' of which the two parts (numbers)
are known as:

<Handle Prefix>/<Handle Suffix>

or as

'unique naming authority'
/

'unique local name under this naming authority'.

Anyway, after I found
'The Internet Engineering Task Force (IETF)', of which:
'The goal of the IETF is to make the Internet work better':
http://www.ietf.org/

it made clearer that there is a registration procedure of
'naming authorities', as well as and this is definitely
a work which currently in progress, since on July 12, 2010,
the registered Name Assigning Authority Numbers (NAAN)
are only 54:
http://www.cdlib.org/services/uc3/naan_table.html

while among of them there is no NAAN for NASA or NTRS.

Anyway, this is really a very helpful reference system
for the Internet, but only *after* someone have search and
find the document which looked for, along with its unique
handle, of course.

Once again, thank you very much Mr. Lux for pointing out
this very interesting issue!

Just goes to show you, if you can think of it, most likely, someone else
has already done it.

I would use a core with no air gap (but, if it was all I had, I'd use
one such as the author of the article did.) If you have/like ferrite
material, a FT114-43 (FT114-61, FT114-77, etc.) should work. If you
like iron a T130-2, T130-6, etc. should work. I simply mention these
because the ID would pass over a pl259 with a few turns of thin wire,
larger ID toroids should be fine. I would think you can use whatever
you have which will fit over the connectors you are using on your coax.
Simply wrap the turns on the toroid, pull the connector off the
tuner/rig, slip coax through, reconnect coax.

I just happened to have a T200-6 in a drawer here. So, I wrapped a few
turns on, slipped it on the coax, ran the secondary through the 50ohm
shut, diode/cap, and to a cheap VOM. With ~100w and the coax into a
50ohm dummy load, the reading I get is just reflecting the loss in the
coax from the 95% braid I am using, most likely. With the coax from the
ant, it appears it would be usable from 40 - 2m (bands limited to my
antennas.) This should easily cover 160m to well below 2m. For SHF and
EHF you may wish to choose a torid of differing material.

Thank you for finding and posting that article. It was a fun read!

Regards,
JS

```

I've had a really nice 130-foot doublet fed by ladder line hanging between two trees for the past three years.

It's hung using 3/16" black UV-resistant polyester rope in the trees, and has a pulley and a 15-pound counterweight (plastic jug of sand) for tensioning at one end.

It's held up remarkably well over those three years, but I had noticed that the rope while still fundamentally flexible was kinda "hardening".

Where it went through the tree branches there was remarkably little wear over the three years. There was some black fluff where some chafing had occured but it still was holding up nicely.

But I went ahead and replaced all the rope anyway. With the tennis ball cannon I actually got the new rope hung a little bit higher than the old rope.

Just by touch, the new rope feels flexible and supple, and I contrast that with the old rope that isn't exactly "brittle" but does not feel nearly as flexible. The new rope felt kinda like a towel just having been washed and dried; the old rope felt kinda like a towel that had been used to mop the garage floor and then left lying there to dry. Maybe the feel was just grime and dirt that the rope had absorbed over the years?

I fixed a couple of broken ladder line insulators, and inspected the plastic end insulators too. The UV-rated polycarbonate that I had used for the insulators seemed to be holding up fine, although it was no longer crystal clear and had a good amount of grime and haze on it. Certainly didn't feel "brittle" yet.

I did replace the plastic jug of sand that's used as the counterweight. I had painted the jug brown and green to kinda blend in with the trees but even despite the paint layer I was a little worried about the plastic deteriorating there. On a previous antenna I had used a 1 gallon plastic milk container to hold the sand and that didn't even last a year before decaying. I'm using some darkroom container jugs now, with some extra reinforcement rope through the handle on the interior, and they seem to hold up OK.

Is three years a typical "good repair" replacement interval for ropes in trees? I think it probably could've stayed up another 10 to tell you the truth.

Re-hanging the antenna back up after replacing the rope felt so good.

It is beautiful to see it stretching from treetop to treetop one
hundred feet up.

Tim N3QE

The front end of many of these portable SW radios is typically "hot" and has no problem hearing band noise with just the built-in antenna. That doesn't mean that it's the world's most perfect antenna, it won't hear nearly as good as something 100 feet up in the air, but it's fine for the flamethrower SW stations.

But if you attach a longwire... you may find that you have intermod issues with local AM/FM broadcasters. The front end in most of these portable SW radios has very little preselection so they're susceptible especially once you raise the local broadcasters to the level of hundreds of millivolts. A tuner of some kind will help here.

Tim N3QE

no they don't. that discusses a rather unique situation of an antenna
in a very low pressure plasma.  another case where google supplied
irrelevant information because of your ignorance of the actual physics
involved.

oh yes, i remember hot coco... at one point i had 4 floppies and extra
ram extension on my coco.  that was when i was using it as a bbs.
finally turned it into a repeater controller in the mid 80's.

Babbling nonsense contradicted by about a hundred years of empirical observation.

Thanks, you saved me a lot of trouble.  And, when addressing a room full
of engineers from such varied programming experiences, one would use
pseudocode, a "universal language."  Indeed, a thesis would utilize the
same ...

Regards,
Mr. Ostrom

only if the thesis didn't care about the exact implementation, but did
depend on the algorithm. if the code were just a tool used to crunch
data, which is what it sounded like in that part of the discussion,
then the code itself may not even be part of the thesis, just the
results of crunching.

Owen Duffy wrote:

> The article also shows a BNC connector option which IMHO is superior to
> F connectors.

BNC compression connectors are available. They are much harder to install properly than F connectors, but once you "get the hang of it", they work fine and are sturdy. BNC to UHF adaptors are also available, and the ones I have seen are better quality than the F to UHF ones.

I don't know if they are as water resistant as the F connectors designed for outdoor use, but UHF (PL-259) connectors are in comparison sponges, so if you are used to them, you should be able to deal with BNC connectors.

Note that there are different connectors for RG-59, RG-6 (not quad shield) and RG-6 quad shield, and they can not be used on cables they are not designed for. Either they don't fit on properly and don't make connections, or fall off. :-(

You can buy a package of compression 50 BNC connectors and the appropriate tool with international postage for about $50 on eBay.

There are three kinds of compression connectors I have seen so far. One is a one piece solid connector, which when compressed, the back end folds into itself (think of a metal accordian). The second is made from two pieces fitted together, and when you compress it, the part in the back is compressed into the front.

Both work well, and if you get the trimming right, will fit well. I found on the two piece verisions I have, the center conductor has to be trimmed to 3mm. 4 or more and they fall off. :-(

Note that when I say two piece, when you get them they are both one piece and can not be separated. It's just obvious that not counting the ring, they were made from one or two pieces.

There also is a third kind I have so far only seen in F connectors where the front pushes into the back. I tried many in all sorts of ways and cables, and either end up with it falling off, or making a solid fitting but no contact to the shield (ground). :-(

Any advice on how to get them to work would be appriceated. I still have around 30 of them.

Geoff.

Hello,

We would like to thank you all very much for your kind attention you paid on our work; especially, since the appearance of vemsa3d 1.1 announcement is still delayed for 5th day, as we will like to reveal, in some other e-mailing ham antenna lists commercially moderated outside the USENET. Well, we tried to collect all of your remarks which are strictly related to vemsa3d, and here are our due answers:

1
The reason for which the code was translated from FORTRAN to C++ was to establish a uniform language environment, most appropriate to be a graphics oriented one, from the scratch.

2
The reason for which the transform was made line-by-line was to fully control the reliability of this transformation.

3
The reason for which we used RichWire -that is our fully analysed and then revised Richmond's FORTRAN code- beyond those reasons mentioned in our page limited paper, as it is already pointed out by Jim Lux, was that NASA does not put any restriction in its public domain code on the number of modeling current modes, that is on its modelling capabilities.

4
The reason for which we focused and concluded with that particular horn comparison example between 4nec2 and vemsa3d was to emphasize that very important restriction on the limited modelling capabilities even with physically short electromagnetic objects like that horn for which we exceeded the maximum number of 4NEC2 permitted dipole mode currents by a factor of about 4, that is up to almost 5,500+ dipole current modes.

5
Finally, the reason for which we carried out this overall tedious, much time-consuming, work was to stop discouraging "the little men" like us -not only the guys of John Smith but the dolls too- from being involved with the electromagnetics

modeling interiors, on which, some other people, had been artificiallly put knowledge barriers. From now on, as we hope, there is no self-excuse for no one to hesitate in trying his/her forces on this, most demanding, most challenging, multi-discipline field.

Well, after the above clarifications, we don't see any other, either straight or impled, question among your very welcomed indeed comments, which is strictly related with vemsa3d and remains unanswered. Anyway, if there is indeed any point that was missed our attention and you are really interested to be cleared, please definitely put that to try to answer it too.

I gotta go, the "ring of idiots" grows ... you are new addition?  I
don't remember you from years ago, like I do richard ... but makes no
difference ... anything code-able in a language is code-able in pseudo
... indeed, things impossible to code in a real language are possible in
pseudo ... any software engineer can validate that ... ROFLOL

Thanks for your points and information. Sorry about "the little display here." As you can probably guess, a lot of the BS is over old and past threads and exchanges. I hope you don't feel anything I said was pointed at you or your information, it was not--I assure you, other than to note I considered it a worthwhile addition to the "toolshed."

Thanks for your time and patience,
JS

OK, I sent two pictures in a private email to your address on
qrz.com.  For some reason, I only see part of your email address
here.  (My email provider discontinued Newsgroups this year and I'm
still getting the hang of Google Groups.  Maybe I should try Yahoo
Groups or pay for a real NG server.)

if you can't code it in a 'real' language how would you code it in a
pseudo code? that just doesn't make sense. the whole purpose of
pseudo code is to help work out logic and program structure at a high
level. it wouldn't be much good if you couldn't break it down into
actual code in the end.

Agreed.

> the whole purpose of
>pseudo code is to help work out logic and program structure at a high
>level.

Your interpretation of pseudo code seems much broader than mine. I view pseudo code as a non-verbal means to describe the nuts and bolts of an implementation. I don't see pseudo code having the ability to describe design patterns, even basic procedural patterns such as inheritance, polymorphism and encapsulation. Pseudo code just isn't abstract enough and doesn't scale well enough to communicate larger, more general concepts, principles and ideas.

A design pattern might call for a collection of references to objects where pseudo code would use an array of pointers. Abstractly they are the same but while a pointer is a reference, a reference per se does not have to describe an object's location in memory. A reference could be something as simple as an index into an array. It's a subtle difference but most meaningful. In this example the design pattern can be implemented in C# while the pseudo code presents a stumbling block.

Then again at certain levels of abstraction, design patterns might be described as being pseudo code. Design patterns are very useful in revealing what public properties and methods types will require without drilling down to implementation specifics.

>it wouldn't be much good if you couldn't break it down into
>actual code in the end.

Design patterns can do this nicely for OO languages. I can't speak for FORTRAN as I haven't had occasion to use that language in almost forty years. Still it seems a FORTRAN flow chart would fall somewhere between design patterns and pseudo code. A flow chart does describe a specific design without specifying implementation details.

there is OO fortran also!

Try:
http://www.forteinc.com/apn/index.php

for $3 a month you get 12 Gigabytes download capacity.

At the rate I draw from that capacity (in the Kilobytes) I should have
to pay a penny a year instead - but they don't offer that kind of
plan.

I got them!
I think it will be a while but I am slowly accumulating stuff for the
project. I am especially interested in how mechanical problems are
handled.

I use a few concrete blocks on my antenna projects too!

Thanks for the info,

You're welcome. The OP said his dish was 2.5m; how big is yours? Or do you have one yet?

I had a 2m solid dish for a few years (unused) and finally gave it away. That thing was heavy. I never had the whole mount for it -- just a tripod frame off the back of the dish -- so I can't offer any direct suggestions. One idea, if you have a communications company nearby, like the area cable-tv provider, maybe a friendly tech will let you into their yard, where you can examine how their dishes mount. Just a thought.

My other dish, a ten-foot mesh unit with which I watched premium programs for fifteen years, is now in EME service a few miles from here. Are you thinking EME?

Looking for something else, I found this:
http://www.qsl.net/wb1gfh/zepp.html

He also had a page offering this:

http://www.qsl.net/wb1gfh/antenna.html

Mainly, his dialog was humorous. Anyway, thought you might enjoy it.

Regards,
JS

I have built a 4 element Delta loop for 20/17/15/12/10 meters and it has full gain for each band. I have been working with this antenna for some 20 years now and have got it working pretty good. If anyone wants to see my figures, go to rgantennaparts.com to see information about this great antenna. I am presently building a 7 band 2 element rotatable delta loop. This antenna has the 40/30 bands included. The figures for gain, back to front ratio and matching impedance are there. This antenna has wire supported by fibreglass poles instead of the regular aluminum elements.

The connector itself on the TH-F6A isn't particularly strong, but there
is a raised ridge around it on the case that the supplied rubber duck

rests on to take the mechanical loads. If you're putting a different antenna on, what you probably want to do is what a colleague of mine did: find a nylon bushing that's just the right height to support the bending load of the SMA/BNC adapter on that same ridge. Rummaging at the local hardware store he found one that required only a tiny bit of sanding to make it work.

Then, he did the usual "two right angle BNC adapters" to further relieve the stress loads.

I have some professional Fischer current probes (clamp-on current transformers).

For a simple dipole, balun, 50 ohm coax feed system...
It seems to be that I can simply clamp one on the rig side of the balun, and see how much current is flowing and compare it to antenna current. I can clamp it on either, or each antenna leg near the feed point to measure antenna current.

It'd also be interesting to probe several points along the feed line.

Anyone see anythhing wrong with this reasoning?

73, Steve
PLEASE also respond via email

Hi Steve,

You will have the length of the line leading to the probe in the radiation field and it will disturb the transmission line coupling to that same field, changing the current characteristics. At some point, it won't matter, at other points it may matter considerably - the trick is knowing one point from the other. What will be happening is that you will force a common mode into a balanced circuit, or will be further unbalancing an already unbalanced load with that long length of line.

In other words, it will be a joker in the deck unless you choke that line too.

The question then comes to this: Why are you doing this? Is this some form of classroom experiment with what was called Lecher lines? Measuring SWR? If so, you might find that you are pushing the current node along the line (like a bead on a string) as you slide the probe. At some point the node will pop back to its original position and if you are trying to plot current points, they will exhibit a curiously distorted shape. This can occur through overcoupling the probe to the line.

> It'd also be interesting to probe several points along the feed line.

You realise of course that the common mode current is almost certainly a standing wave, and meaasurement at a single point is not a reliable way to characterise a standing wave.

I know that this is not consistent with the widely held view that a common mode choke creates a demarcation point where common mode current can flow on one side and not the other.

This is the pitch for the very popular Carolina Windom which advertisers and promoters claim leverages the radiation from the vertical feedline section on one side of the "isolator" but there is no undesirable common mode current on the tx side of the "isolator".

>
> Anyone see anythhing wrong with this reasoning?

To assess effectiveness, don't you first need to take inventory of what it is supposed to do, then assess its performance against those criteria? Have you a list of expected benefits?

There are a lot of flawed common mode current measurment articles around, and even some commercial instruments that seem not cognizant of the fact the line currents are complex quantities (eg at least one MFJ 'instrument'). Most reports I have seen of "I have common mode current 20dB down" speak more of the reporters lack of knowledge of the problem and measurment technology than 'clean' status.

If for instance, one of your benefits was reduction of receive noise level due to proximity of common mode conductors with household noise sources, then your current test is not likely to be a good measure of that outcome.

If the objective is EMC improvement on tx, then isn't the best test observation of interference to yours and your neighbors TV, HiFi, computer, telephone etc? These effects usually incorporate a threshold effect, and if field strengths are below threshold, your home free.

I am not familiar with the equipment you have, so ask the question, can you measure the phenomena without significantly disturbing it? If I was designing a common mode current probe, I would think of a small self contained thing with a panel DMM readout, battery powered, and that could be clamped to a conductor and read remotely with a telescope. Anything with substantial length of conductors is likely to be a problem.

Owen

Ideally, the high-impedance "isolator" causes a reflection of the forward common-mode wave back toward the antenna. This ideally results in a current node (minimum) at the "isolator" and ideally confines the common-mode standing wave to the feedline between the "isolator" and the antenna. That's the theory behind the Carolina Windom. How it performs in reality is another question.

It should be easy to measure the common-mode current at a few points between the isolator and the antenna and at a few points between the isolator and the shack to determine just how effective the Carolina Windom "isolator" really is. It should also be possible to model the situation with EZNEC - no, not a perfect model, just close enough to observe the effect of the "Isolator".

Does anyone know the choking impedance for the Carolina Windom "isolator" over the spec'ed frequency range?

A strategy that is used in antenna research with bolometers is to use wires with an impedance of 377 ohms/square so they "look" like free space and don't perturb the field. I haven't seen these as a commercial item, so I suspect that they are fabricated by the researcher: perhaps by cutting from sheets of so called space cloth or paper (which has the required sheet resistance)

Check out the work by Bolomey, et al., with measuring fields with "modulated scattering probes" (put a small dipole in the field with a diode in it that you can turn on and off with a DC bias, supplied by resistive lines)

The idea is to increase the radiation resistance, not to decrease it, so
has to increase efficiency.

>
>>
>> The 8 radials will be 4 feet long with loses of aprox 5 ohms, so
>> efficiency will be near 94%.
>
> This isn't entirely clear to me.
>
> Owen

If I define radiation efficiency as:

Rr/(Rr+Rl)

where Rr; radiation resistance
and   Rl: loss resistance

and take Rl=5 ohms for 8 radials of 8 feet each

For a 25� length radiator: 36/(36+5) = 88%
For a 32� length radiator: 100/(100+5) = 95%

Losses are reduced from 12% to 5% by only adding 5 feet to the 20 meter
vertical quarter wave antenna and with a 75 ohm coax of 1,25 wavelength
I can get a perfect match to a 50 ohm output impedance transmitter.

The 8 radial can be as short as 4 feet long for the same results.
I came to these results from R. J. Edwards (G4FGQ) program ENDFEED.EXE
It's interesting to note, that radial longer than 1.3m (4 feet), always
increase earth looses.

The complete modeling results can be seen at:

| How does this work differ from NEC Numeric Electromagnetic Code for antenna
| analysis?
|
| Bill Miller
- -

Dear Mr. Miller,

VEMSA3D can not work differently, because it is based
on the same theoretical method as NEC does, that is on
the Method of Moments.

However, since each of these numerical applications use
a different basis of the current function space and since
their corresponding computer programs use unavoidably
finite linear combinations of them, in general, they
produce different results.

To be specific, the two bases details are included in the
following:

VEMSA3D current basis:
J. H. Rischmond, Radiation and Scattering by Thin-Wire
Structues in the Complex Freqeuncy Domain, (15), p.6
http://tinyurl.com/24zwycy

NEC current basis:
G. J. Burke, A. G. Poggio
Numerical Electromagnetics Code - Method of Moments
Equation (20), p. 11
http://www.si-list.net/NEC_Archives/nec2prt1.pdf

Regards,

Petros Zimourtopoulos

The model sensitivity to radial length suggests that the radials are modelled as short transmission line immersed in a lossy medium, in which case, the assumptions about soil conductivity and permittivity are very important to the model accuracy. It is unlikely though that shallow buried radials are very consistent in behaviour due to the effects of rainfall.

It would be interesting to measure the antenna and compare it with your model predictions.

Can you quantify further or explain the nature of thes "different results?"

Are there certain classes of antennas for which VEMSA3D might produce more
accurate results than NEC?

Thanks!

Bill Miller

I use a lot of compression F connectors that are truly 2 pieces with
the back piece being pressed into the front.
The front part has an extension that *just* fits over the foil and
under the braid and jacket. The back part is a snug fit on the jacket.
When the back is pressed into the front the forward part with a soft
plastic gasket compresses down on the jacket and braid giving a strong
connection to the braid and foil. The center of the coax (RG6) forms
the center pin of the connector. I just leave it long until after the
connector is installed. Then trim it off about 1/16th inch in front of
the connector. You can go a good 1/8th inch or cut it flush so there
is lots of leeway.

I use a commercial pair of pliers made for installing these, but it
would be fairly easy to make up a set of pliers if need be.

And when I click it in Roger's quote of the original post, it works for me.
Why would that be?

Owen

Hacksaw, the tool of professionals. Boltcutters work on the cheap SS
whips, but a good spring steel whip can divit bolt cutters. A carbide
cutting disk in a dremel tool or grinder is another option.

For those "tool challenged" a hacksaw blade with several wraps of duct
tape around one end will work.

Regards,
JS

Well, I can try. These numerically different results are due to the different coupling -reaction, or impedance- between two current distributions for which different function -expression, type, formula, or equation- is used to describe them in each one of the two applications, VEMSA3D and NEC.

|
| Bill Miller
|
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
```

You are welcome!

VEMSA3D is a thin-wire polygonal modeler in "free space". Therefore, it has to "exactly" predict or justify the characteristics of any thin-wire antenna. For this class of antennas VEMSA3D can be certainly compared with NEC. Anyhow, this comparison can only be indirect: you have to build and measure the specific thin-wire antenna first and then to overlay the results of both applications upon the measurements. But since this kind of knowledge is definitely a posteriori, you can try a comparison of both applications for *any* class of antennas. Here, only the advertisement builds knowledge a priori; but usually this is followed by a deep disillusionment.

Regards,

Petros Zimourtopoulos

If you're talking a good quality whip, like one made from 6140, you will ruin your pliers or even the best bolt cutters you can find. They may work on cheap whips, like the ones on discount store CB antennas, but not on a good quality whip. And it seems that some of the 'thinner' whips are tougher than the thicker whips.

Notch it with a file or an impregnated fiberglass wheel on a rotary tool, than bend it sharply and it should snap off clean. The harder the steel and the more difficult it is to cut, it seems the more brittle it gets, and the easier it is to snap.

I like how everyone ignores the elephant in the room, thought I would keep quite, sit back and see if anyone noticed the elephant stepping on their foot--case of numb feet I guess.

So: What about MMANA-GAL. MMANA-GAL is about an exact work-a-like as you can get to NEC. Is free, has no limitations in software, etc. Are there any advantages to your program? Accuracy?

Regards,
JS

Hello, again, JS!

For MMANA-GAL, I just took a look at:
http://mmhamsoft.amateur-radio.ca/pages/mmana-gal.php

where you can also read that, according to its developers,
this application is a descendant of MININEC, that is of NEC.
Therefore, there is no need to add nothing more on what already
written in some previous articles of this thread about VEMSA3D
and NEC.

Furthermore, I also just took a look at:
http://dl2kq.de/promm/

where you can read too that its developers clearly exhibit its
license and capabilities limitations. Therefore, there is also
no need to add nothing more on what they already wrote -not to

mention what it is lengthy said about software pattents and usage restrictions in this tread.

Finally, the accuracy issue is also has been exhausted in yesterday article:

| Sent......: Sunday, August 22, 2010 9:38 PM
| Newsgroups: sci.physics.electromag,rec.radio.amateur.antenna
| Subject...: Re: vemsa3d 1.1 - a floss visual em simulator for
| 3d antennas
| From......: pez@grnet.gr

so I have also nothing to add.

Well, after all, it seems that we only forgot to mention the name of that elephant in the room -perhpas because its advantageous name is /F/L/O/S/S/.

Best regards,

pez

You are obviously not renting from Herr Commandant Earl Kennedy. He
doesn't allow shit except for maybe a long wire run through the trees.
If he can see it, he says take it down. I can't wait to move to a house
that is farther out and he doesn't own.
Bill Baka

I didn't start this to be a flame war, but I should have known.
As for really high magnetic fields they have levitated a mouse in the
lab with about 5 Teslas interacting with the water in his body.

HVDC distribution systems over long distances are not that uncommon.

http://en.wikipedia.org/wiki/High-voltage_direct_current

The Pacific DC Intertie from Celilo, Oregon to Sylmar, California is just
under 2,000 km long and runs at .5 MV.

well, actually edison was right... and many long distance transmission lines today are DC at up to +/- 600kv, that will put a crackle in your snap and pop! There are also places where interconnects between major AC systems are done using back to back AC/DC converters so that the systems can be isolated due to voltage or frequency control issues. don't count out large dc motors either, our submarines have been using them forever... even nuclear subs have dc propulsion systems. All solar panels start as DC, as are most of the storage systems for them, and don't forget plugin hybrid or all electric vehicles, most all of them are dc powered. There is also a new move to use DC distribution in large data centers to reduce heat from transformers and simplify backup power systems. most subway systems and electric rail i believe are also dc powered. and believe it or not, there was still a block in nyc that was provided with dc by ConEd until 2007, and as i understand it they had to provide custom rectifiers for some equipment that was still in use so they could retire the rest of that system.

I never seen this as a problem or a road block. You are simply a matter
of all the knowledge you have picked up from others along the way, most
likely, a large portion of this came from copyrighted materials.
Indeed, if I read a copyrighted book, then turn around and write a book,
containing all I have read, I have done no wrong; If I copied the work,
I am.

When it comes to math, removed from other works, it is exactly the same.
You would have to be an idiot to do it in such a way as to cause problems.

This is all so self-apparent, it always puzzles me when I am brought to
putting the concept(s) to text, or even spoken speech!

Regards,
JS

" Due to the space charge formed around the conductors, an HVDC system may have about half the loss per unit length of a high voltage AC system carrying the same amount of power. With monopolar transmission the choice of polarity of the energized conductor leads to a degree of control over the corona discharge. In particular, the polarity of the ions emitted can be controlled, which may have an environmental impact on particulate condensation. (particles of different polarities have a different mean-free path.) Negative coronas generate considerably more ozone than positive coronas,"

But what it works in your antennas.

FORTRAN is pretty much a dead language, although you will find strong argument to that statement in some math circles. While I do agree that language makes little difference to software engineers, most being fluent in many/multiple languages, a C translation just keeps the code, more, up-to-date.

And, none of the above is of any real importance, other than complete, or even substantial fragments of, programs can be copyrighted. But, I am sure there are millions of "for statements", etc. in code that are exact duplicates of some found in Microsoft Windows, etc. To claim that the truths of mathematics is patentable is just stoopid.

However, all that said, there are such things as "encoder algorithms", for an example, and such, which are so narrow and contain such an exact and specific set of math instructions to execute and obtain reproducible results from, that the validity for a patent is quite obvious. However, as has been demonstrated, for any patented algorithm which has yet been created, a freeware solution which is either so close in effectiveness as to make it a moot point, or even greater in effectiveness--an example is MP3 format (patented) as relates to Ogg Vorbis format (public domain.)

The future where patents cause real road blocks in software development, or even "hoops to be jumped through", is still in software engineers' future.

Regards,
JS

Whoopee, you can cut and paste from a web page, what a genius.

> But what it works in your antennas.
> S*

It has nothing to do with antennas, moron.

don't bet on it. microsoft just had to remove a major feature from word because of patent infringement. and there are lots of cases where companies have to buy rights to use patented features before they can release their products, compression algorithms are just one of many things that have been patented. even the cursor and the mouse have patents. fortunately most of my work is using standard tools that come with distribution licenses, and the stuff i develop that is unique is from our own research programs so we obviously own the rights. but if i find a free tool that has something that will make my job much easier i have to submit the license to our software quality and then maybe legal offices to be sure we can use it without infringing. you know those long license statements that no one ever reads before installing something?? most of them unfortunately make sense to me now.

maybe he does try to use dc on his antennas?  kind of low data rate,
but it would suffice for anything logical he had to say.

While I do agree that language makes little difference to software engineers, most being fluent in many/multiple languages, a C translation just keeps the code, more, up-to-date.

FORTRAN is far from dead in applications processing massive arrays (just about any finite element program). For instance, I'd venture that most weather prediction codes are in FORTRAN (MM5, which is a widely used mesoscale modeling code, is in FORTRAN, as is WRF), as are a lot of structural analysis (e.g. NASTRAN is in FORTRAN), and virtually ALL electromagnetics codes.

FORTRAN is hard to beat when it comes to specifying array operations, and such. Running gridded models doesn't require much in the way of pointers or string manipulation, which are admittedly a pain in older FORTRANs (pre FORTRAN-90 or FORTRAN-77). FORTRAN also has an intrinsic Complex type which is nice.

Compilers for numerical analysis applications (e.g. those weather grid models) for FORTRAN are highly optimized, too. There's also nifty tools like FLIC (FORTRAN Loop and Index Converter)

There's even new versions of FORTRAN coming out.

> However, all that said, there are such things as "encoder algorithms", for an example, and such, which are so narrow and contain such an exact and specific set of math instructions to execute and obtain reproducible results from, that the validity for a patent is quite obvious. However, as has been demonstrated, for any patented algorithm which has yet been created, a freeware solution which is either so close in effectiveness as to make it a moot point, or even greater in effectiveness--an example is MP3 format (patented) as relates to Ogg Vorbis format (public domain.)

Unless you need compatibility and interoperability. Sure, there are non-patented communications coding schemes like LDPC that give better performance than, say, Turbo codes (patented), but if you need to build a radio that interoperates with a radio using Turbo codes, you're pretty well stuck.

All the various high performance low bit rate voice codecs have similar issues. All the "good" ones are patented, as well as most of the "not quite so good", and the patents are broad enough that you would have a tough time designing around them. (which is actually, I think, how it should be.. patents *should* be for fairly general conceptual leaps, not for some fiddly little detail that's different.. that's what "design patents" are about)

Fortunately, the patents *will* expire. Unlike copyright, which has an ever longer tail.

>
> The future where patents cause real road blocks in software development,
> or even "hoops to be jumped through", is still in software engineers'
> future.

I don't think so. It's here now, especially if you consider advanced signal processing or protocol handling in software. The software is just the means by which the invention is realized, and it's no different than doing it with discrete hardware components. While raw "algorithms" and "math" can't be patented, a clever and efficient implementation technique certainly can be.

> feedpoint.
>

I though about this while on the road this morning. Sometimes
enlightenment comes when there is not a keyboard to confuse things.

I assumed that he intended to model the shunt coil, and correctly
modelled it, but in fact his load is in series with the feedpoint...
so it hasn't captured the shunt coil.

Removing the load, and running the model gives a feedpoint Z of 16-
j500. A shunt coil with Qi around 100, and L around 29uH will
transform that to 50+jX. That coild has an equivalent shunt R of 120k,
so negligible power is lost in it.

I haven't looked closely at the model in all respects, but it seems to
do some crazy things that certainly give unrealistically low
efficiency.

Owen

These days, I choose to program, almost exclusively, in assembly and C/C+/C++ (all C looks the same to someone writing in it.) If someone hands me a FORTRAN coded work, I can read it, but it tends to look like a mess to me. I simply run it though a source translator/optimizer and I have C code. When I am done, if they requested the result in FORTRAN, I run it back through the translator in reverse. C is simply a universal language which has the most favor with engineers and which has become the industry standard. Like I said, arguing language is a moot point ...

> FORTRAN is hard to beat when it comes to specifying array operations, and such. >

FORTRAN is not "hard to beat" at anything. Assembly instructions are the only "real code" which a processor understands, it is the binary language of processing units. There is not a computer language in existence which does not translate to assembly before execution. FORTRAN and C only differ in semantics. While FORTRAN was an attempt to make the language more readable in translation, C is an attempt to make the language more efficient in translation. The goals of the two languages are not exact.

> Compilers for numerical analysis applications (e.g. those weather grid models) for FORTRAN are highly optimized, too. There's also nifty tools like FLIC (FORTRAN Loop and Index Converter)

The meaning of that is just moot, and implies an argument for leaving something unoptimized would be someones goal, somewhere, for what purpose that would be baffles me!

That is some gobble-de-gook which defies meaningful translation ... perhaps a dynamic demonstration of obfuscation? To someone outside the field, I can see how it might just work!

The best ones have not even been thought-of/invented yet! However, you
remind me of that patent office employee who once mentioned "the fact"
that most patents had already been patented ... and your statement is
just as valid as his!

...

Yeah, as if someone grasping at straws and thinking that "just owning a patent", in someway, is some kind of status symbol ... something which fails to impress anyone worth impressing.

Yeah, most people double check their work(s) and have others do so, if available ...

Frankly, I find that amazing, indeed, it implies insanity to me.

Why anyone would allow a thesis to be done which would favor a
particular language defies rationality.  As, language is only a device
for the implementation of truths, ideas, algorithms and laws.  It is the
underlying structure of math and logic which are the only important
points.  To express these in a form speaking to computer engineers, a
"language" such as pseudo-code would be the logical choice.  To do any
different simply implies there are interests at work other than pure
science.

Are you sure a FORTRAN compiler/developer with financial interests did
not back this academic venture?  ROFLOL

There's a lot of sports programming available in the clear, both analog and digital. On a far west C-band satellite (135-degrees West, I think) I could still get the Alaska network digital feeds until recently in San Diego. (I took down my 10-foot C-band dish a few years ago, so my knowledge is getting stale.)

Much info is available on skyvision.com and satelliteguys.us . Also see lyngsat.com and sadoun.com . The science of cataloging what's available is not perfected, as the programmers don't care that we know what's on -- unless we're paying customers. :-(

The fun is building the gear, especially antennas and mounts. I hand-built a geometrically-correct polar mount out of the pipe from a DirecTV wall mount and an ordinary TV antenna rotor. It tracked the arc perfectly for a small Ku dish. I still have it and I'll post a picture if anybody wants to see it.

I hope this helps.

"Sal"

Your antenna is a high voltage AC system.
The loss is a loss of electrons.
Try to measure it.
S*

there is no net charge build up on an antenna due to rf.

well, that just blew any credibility you had with me.  c+ is a joke,
c# is real, and no, all flavors of c don't look the same!  far from
it, someone who knows c would be lost doing c++ or c#.

and yes, there is a huge fortran codebase out there in scientific and
engineering circles.  many of the largest modeling packages use
```

fortran for at least the backend, even if the frontend has been
rewritten in a more gui friendly language.

```

antennas work just fine without a ground.  how do they work in
airplanes?  how about spacecraft?  yes, i know, you like plasmas that
provide the free electrons... but you are wrong.  take a transmitter,
encase it in rubber, put it in a vacuum chamber and pump out all the
air, and you will still receive it.

See at the fig. 1: http://amasci.com/tesla/tmistk.html
Can it work without Gnd?

You can use a chassis.
Transmitter is only a oscillating pump. Such must has a tank.

Antennas work just fine without ground.

Have you ever heard of airplanes, radiosondes and spacecraft?

Gibberish and nonsense based on ancient crap.

Connect an RF source through a transformer with the secondary connected to
a dipole and hang it from a balloon; works fine and no ground or chassis.

Sounds more like a case of pot-kettle-black.

Whether you like it or not, and whether you can accept the fact or not,
what he says is true.

>(especially 0.25, 0.75 lambda, etc) length, you may get change in VSWR
>(can be both better or worse).

Additionally the dipole may be a better match for 75 ohms than 50
depending on height and surrounding conditions.
I used 3/4" 75 ohm coax for low loss, long runs for years with no
problems and never paid attention to length.

OTOH at times using a commercial multi band vertical I had to play
with the 50 ohm coax length even when the antenna was a good match.

Stateside the F to UHF connectors are relatively inexpensive and
common. They may not be the best quality but work well indoors.

Welll... I had a number of HTs using BNCs over the years. The ones that were used a lot in general needed the Chassis connector changed once a year. I've yet to have to change an SMA.

That should be fine. See my notes at http://vk1od.net/transmissionline/RG6/index.htm . See Fig 2, RG6 should handle over 1kW continuous at 14MHz at unity VSWR, over 500W at 2:1 VSWR.

The article also shows a BNC connector option which IMHO is superior to F connectors.

...

An alternative method of matching is to shorten the vertical a little from a quarter wave, and use a shunt s/c stub. See http://vk1od.net/transmissionline/QWVmatch/QWVmatch.htm for a description of this and another method of matching.

>

This isn't entirely clear to me.

Owen

OK. I dug it out and I'll snap some pix later.

Questions: Do you understand the geometry involved in a polar mount? How about the concept of declination, whereby you compensate for the fact that you are not on the Equator? When I bought my 10-foot dish (1986) it came with instructions that included a table of declination vs. latitude and a corresponding adjustment scale on the mount itself. With a do-it-yourself dish, you have to "do it yourself." hi hi.

I ask because the web has a number of tutorials on the subject of backyard dishes. If you don't already have the knowledge, you may wish to search now. Not a big deal, but if you fail to apply the correction, you can't track the arc faithfully.

On the side: We are discussing herein a polar mount, whose operation adjusts azimuth and elevation simultaneously. There is also an AZ-EL mount that permits you to manually aim at each satellite, based on pointing info derived for your location.   Simpler, but not much fun to build.

It says a lot about ability and self esteem when someone has an email address like his and says the things he does. My guess is that I have made a lot more money programming than he ever will. And in a lot more languages. And a lot fewer bugs.

amen on that... lets see, 42 years programming now, 26 getting paid
just for that, languages??? pdp8 assy, focal, fortran(several
versions), basic(several variants), pascal, x86 assy, vb, ada, c, c++,
c#, vb.net, asp.net, various jcl variations, ibm360 assy, 68xxx assy,
objective c, pl-1, apl, java, javascript, vrml, html, xaml, xml,
matlab, mathcad, and probably a few others i have forgotten.

PDP8 assy? 12 bit machine wasn't it? (didn't look it up, not cheating)

I rebuilt one after someone plugged the TTY card into the bus. You may
remember that none of the cards were keyed. Loop current voltage hits
the bus, oops. Lots of RTL and DTL to replace.

Favorite assy was 6809. Did a lot on the Ericsson MD110 while writing
patches.

yeah, pdp8 was 12 bit, everything in octal instead of hex.  i did a
lot of 6809 stuff on a ratshack coco machine, amazing what you could
make that box do once you got inside it.  had one doing fax, rtty, 4
channel music synthesizer, and running a dialup bulletin board even
before aol started sending out floppies.  and i built an 8080 based
desktop computer from scratch in 1977, all of 2k of ram and a hex
keypad to load the programs from manually or from cassette tapes!

> yeah, pdp8 was 12 bit, everything in octal instead of hex. i did a lot of 6809 stuff on a ratshack coco machine, amazing what you could make that box do once you got inside it. had one doing fax, rtty, 4 channel music synthesizer, and running a dialup bulletin board even before aol started sending out floppies. and i built an 8080 based desktop computer from scratch in 1977, all of 2k of ram and a hex keypad to load the programs from manually or from cassette tapes!

I ran OS/9 on my CoCo. I had dual 5 1/4 inch drives, woohoo! Also got a couple things published in Hot CoCo if you remember that mag.

OS/9 was great. Developed by Motorola as a micro based Unix type O/S. I heard it was parallel developed with the 6809 chip with feedback between the 2 teams. It was very fast and very small. Kicked the IBM PC's butt with one fifth the clock speed. As you may know, the 6809 was about as much 16 bit as it was 8, which was probably part of the reason why.

And I still have all of the bits. Haven't fired them up in maybe 15 years. I wonder if the disks will still read.

Start thinking. The dipole is a very long wire. The electrons are emitted
```

from the ends only. The rest of the wire is the chassis.
The very short dipole (0.05 wavelengh) should not work fine without ground.

All antennas are the same:

"In conventional ICP (or TCP) reactors, a rf power is inductively coupled to an antenna placed outside a plasma vessel. Such an external coupling system is known to have several disadvantages. In order to avoid these disadvantages, a new internal coupling system has been developed in which a bare metal antenna is directly immersed in a plasma, thus forming a full metal reactor. This is accomplished by generating magnetic field lines around an antenna conductor, which effectively suppress the electron loss at the antenna and hence suppress the anomalous rise of plasma potential. Magnetic fields near the antenna are formed by superposing a dc current on a rf current along the antenna. This type of ICP enables rf discharges at rather low pressures such as ?3�10-4 Torr due to the magnetron effect. Other characteristics of internal metal antennas are also discussed".

"the electron loss" and "the anomalous rise of plasma potential." apply to all antennas.

I think there has been some efforts to improve feedline decoupling
when feeding a .5wl antenna using radials. This may be such an
attempt.

Jimmie

I want to use an NMO whip for 460 UHF band. I know a 1/4 wave would be
about 5.8 inches. can I cut it to be a 1/2 wave or 5/8s wave? if so what

would the correct length be? this is a straight whip, no coil or spring.
Thanks!

I got an 3' long thin coax cable 'SMA to PL-259' adapter at Houston Amateur Radio Supply. Good for mobile work, or via 3/4" dia. UHF lo-loss coax from CableXperts.com up my 50'tower to Cushcraft 6/2/70cm beam, or via RG213/X to the ArrowAntenna.com 146/440 J-pole on my roof. The antennas are also a match on 224, but not much activity on that band.

Neither will work properly without matching. Without using a matching
device, you are limited to 1/4 wave, or 3/4 wave. And 3/4 wave is not
desirable as you start seeing higher angle lobes past .64 wave in
length. "5/8 wave"
If you have an NMO mount, and want to use a 5/8 wave, you need
one of the NMO mount 5/8 whips with the loading coil at the base.
A 1/2 wave will be high z, and require a matching device.
Without the proper matching, you are best off running the 1/4
wave whip.

electromagnetics.

Electromagnetics is a one form of Electrodynamics. The only form in teaching
program. The others is for selfteaching.
Here are the review: http://www.df.lth.se/~snorkelf/Longitudinal/node4.html

> Any introductory electromagnetics course uses their
stuff.

EM made by Heaviside is a simplification of electrodynamics. Teachers choose
it for teaching.

> if they are too hard for you that explains why you have all
those strange ideas, you are stuck 100 years ago with outdated over
simplified theories that have been disproved many times.

Ampere's longitudinal force was derived experimentally. So it cannot be
disproved.
Current elements (electrons) repel each others and thanks this the radio
works.

A 5/8 wave gives you the highest gain at low angles (which is what you want). The length of the antenna is a '1/2 wave and a bit more'. The loading coil at the base is essentially the rest of the length required to make it electrically look like a 3/4 wave, so that it will have a low input impedance, and be a good match.

Over a perfect ground plane, the 1/4 wave will have an impedance of around 37.5 ohms, and the 5/8 wave around 50 ohms, so the 5/8 is potentially a better match for 50 ohm coax. Also, the part of the antenna which does most of the radiating (1/4 wave from the tip) will be some 6" higher in the sky and, at 460MHz, if the antenna is mounted low down, every inch of height above the ground counts! Despite this, in many situations, you may not find much practical difference between a 1/4 and 5/8 wave.

I found only one practical difference. A 5/8 wave mag mount came undone
on the freeway. I've never had a 1/4 wave come off.

Your magmount obviously wasn't big enough. Was it one of those piddling
2" dia jobs? I've got a 6" limpet, and, with a 146Mhz 5/8 with the 3
turn 'spring' loading coil, there's no was that is going to come off at
any speed (regardless of headwind). Obviously, if the antenna is rigid,
there is more chance of levering it off.

just because he is in the books doesn't mean that everything he ever
wrote is correct.  much of the early writings of all those guys was
wrong, it isn't until later when they had learned from their mistakes
that the final correct formulas of electromagnetics were agreed on.
for best results read modern textbooks, if you try to sort out all the
dead ends they went down from the early guesses you will need 100
years to figure it all out again.

Hello,

Not an antenna expert, so thought I'd ask here.
I've gotten some great info. from you folks in the past, which I really appreciate.

Will be buying a portable sw receiver for a gift.

Many of them seem to come with a built in telescopic antenna.
I guess the intent is to use fully extended, and vertically, although horiz. use also seems to be doable from the pictures, but would sure be awkward in a horiz. position I would think.

How "good" can one receive <30 MHz (and the normal fm broadcast bands) using one of these antenna vertically ?

Aren't most sw signals horiz. polarized, or, by the time they actually make it here, the polarization has become pretty much randomized ?

Will try with a "lon'wire" of course, but thought I'd ask re how good the built in antennas, vert. oriented, are as a general question.

BTW: anyone have any strong opinions on a good $ 250 max table top (preferred)or portable sw receiver for a very non-technical person ?
Would want it to have memories. SSB not necessary.

Thanks,
Bob

Hi Al

Go there and you'll found the "real" of explanation about this antenna
model.

You have obviously never gone to school and have no idea what is taught in schools.

Your posts are babbling nonsense.

Hi Bob,

How good? Not very.

They will pull in the extremely powerful stations, but if you expected
to pick up a particular one, then you have every chance of failing.

>Aren't most sw signals horiz. polarized, or, by the time they actually
>make it here, the polarization has become pretty much randomized ?

Yes.

>Will try with a "lon'wire" of course, but thought I'd ask re how good
>the built in antennas, vert. oriented, are as a general question.

I have been a SWLer since the late 50s. Sometimes I was in the middle of it, sometimes at the margins. Let me explain.

Here in Seattle, most of Europe is over the magnetic pole which makes for miserable reception - others may have better experience. I have had scant reception of Africa, outside of Radio South Africa (I was a club member in the 60s). I had a very different experience with Africa that I will describe in response to your next question below:

>BTW: anyone have any strong opinions on a good $ 250 max table top
>(preferred)or portable sw receiver for a very non-technical person ?
>Would want it to have memories. SSB not necessary.

I took a digital tuned SW radio (available from Radio Shack for $35) to South Africa and casually tuned the bands there. With its whip extended it was pretty boring, but it certainly had more signals than I could hear from in Seattle. I came prepared for underwhelming reception, however. Before expanding on this reception statement, I would point out that "table top" radios are filled mostly with air so that they can be big enough to call "table top." My $35 radio was the size of a large paper back book. I have a $200 radio shack radio that I suspect offers no better performance, but is too large for intercontinental travel.

When we went to Africa, I brought along 30 feet of wire wrap wire with an alligator clip on one end, and a quarter taped to the other. I tossed the quarter over the rafters in our "hut" (built to 4 star guest expectations) or into the canopy of the trees (the height was never more than a dozen feet or so) and tuned in:

I could have listened to so MUCH more, but I took the time to linger and try to pick up a call or interval signal.

There was more radio-activity on SW there, than on AM here; but I had to be there (a lot of this stuff was low power as you might imagine).

The bottom line is, cheap does pretty good if you know the limitations (the whip) and how to overcome them (a penny worth of wire). And, yes, it has memories (probably the simplest thing that could be done for cheap and digital).

More could be said.

wrong, it isn't until later when they had learned from their mistakes
that the final correct formulas of electromagnetics were agreed on.

I am not interesting in electromagnetics. It is the hydraulic analogy.

In Ampere electroDYNAMICS no magnetism.

>for best results read modern textbooks, if you try to sort out all the
dead ends they went down from the early guesses you will need 100
years to figure it all out again.

The XXI century will be the century of Ampere ElectroDYNAMICS. It is the
common opinion.

No, it is not, that is babbling nonsense.

> --
> Ian

I realize all that, but he has no coil. Or at least he implied he
didn't.
He was inquiring about using a 1/2 or 5/8 whip with no matching
device,
which I don't think is too good an idea. Or at least he said no
coil or springs in his post, so I assume no matching.
If he wants to run a 5/8 wave whip he will need to buy the coil
that fits the NMO mount.
The 5/8 won't be potentially a better match for 50 ohm coax
without the coil to tune to 3/4 wave.
I got the impression he wants to cut a longer whip and just
stick it on the mount with no matching at all. Which was
why I said 1/4 wave and 3/4 wave would be his only options
and still have a decent match. And I don't recommend a 3/4
wave whip.
I've almost always seen an improvement using a 5/8 vs a 1/4 wave
on 2 meters. A bit better range, and usually less picket fencing.
I would expect the same on UHF in most cases.
But if he wants to run a 5/8 whip, he is going to need the coil
to go with it.

That's totally different than what I had in mind.
That is just a loaded vertical dipole with capacity hats on
each end. And looks to be center fed, not base fed.

I have a Hy-Gain BN-86 3-30 MHz 1500W 50-ohm balun for sale. I'm
asking $50 for it. The instruction manual can be viewed at:

http://www.thiecom.de/pdf/BN-86.pdf

Thank you for the references. Not good. I didn't realize that the feedpoint contains a 50 ohm resistor (re: 40m EZNEC model on KG4JJH's web site cited above).

Thanks again,

Al W6LX

Just a friendly reminder to everyone. For sell/trade/buy items need to
be posted to rec.radio.swap. Such postings violate the guidelines for
the rec.radio.amateur.* groups including this one.

Hey Cecil, good to see you!  Wife asked if I had seen you about the
newsgroups, I will report your apparent good health to her.
That balun utilizes a ferrite rod anyway.  A homebrew with a toroid
would be better anyway.

Regards,
JS

He does not mention a "50 ohm resistor" in his review document, not show it in his feedpoint picture.

Are you quite sure of what you say?

He does include load of 50+j500 in shunt with the feedpoint, presumably modelling the shunt coil... has that got you confused?

The next question is whether such a load is a good characterisation of the actual coil. The value of R seems rather high.

Owen

what good is a theory without magnetism. it obviously doesn't fit the real world as we know it today. maybe it is your opinion, but its not anywhere i have heard of. ampere's theory dates from almost 200 years ago and was the predecessor of electromagnetics, so you seem to have taken another step backwards, now you are almost 2 centuries out of date.

Wouldn't that correspond to a Q of 10, which is pretty bad for a air core coil. I'd say something like 30 or 100 would be more realistic
(unless it's wound with really fine wire)
(I don't have eznec, so I can't open the .ez file)

Beats me... I've never seen one of these antennas and am going only by the EZNEC model on that web site, as I said in my last post. Says that there's 50 + j500 at the feedpoint. That's a 50 ohm resistor in series with an inductor, isn't it? Or, as you say, a coil with a real low Q. Either way, it's an extremely lossy device that adversely affects the results. Try adjusting the R to a more reasonable value for an average coil and re-simulating in EZNEC and take a look at the result. KG4JJH has measured data in that review that definitely coincides with a 50 +j500 device at the feedpoint.

I opened the document in 4NEC2. Whilst my version of EZNEC cannot read
or write .NEC decks, 4NEC2 can read .EZ format.

If you look at the pic of the coil, a Qi of 10 seems very low.
Nevertheless, it doesn't consume much power.

Owen

I though about this while on the road this morning. Sometimes enlightenment comes when there is not a keyboard to confuse things.

I assumed that he intended to model the shunt coil, and correctly modelled it, but in fact his load is in series with the feedpoint... so it hasn't captured the shunt coil.

Removing the load, and running the model gives a feedpoint Z of 16-j500. A shunt coil with Qi around 100, and L around 29uH will transform that to 50+jX. That coild has an equivalent shunt R of 120k, so negligible power is lost in it.

I haven't looked closely at the model in all respects, but it seems to do some crazy things that certainly give unrealistically low efficiency.

Owen

anywhere i have heard of.

Gravity force, electrostatic force and magnetic force are the real world for

the most people. But not for scientists.
They know that in the space is the place for the one of them.
So step by step they decrease the number of them.
The first was Aepinus who proved that gravity and electrostatic are the same.
The last step was made by Ampere who build the artifical magnet - solenoid.
It means that magnetism is an ilussion like gravity. The all forces are electric.

> ampere's theory dates from almost 200 years
ago and was the predecessor of electromagnetics, so you seem to have taken another step backwards, now you are almost 2 centuries out of date.

Heaviside was not scientists and he has taken another step backwards to Poisson's fluids.
He did not understand Maxwell and Stokes.

Teachers must be in "real world" and wait for the end of works on the Unification of gravity, electricity and magnetism (they are pending).

Hi John, tell the XYL that I'm doing as well as someone licensed in
1953 could be doing. :-) Someone used to post the r.r.a.* newsgroup
guidelines here, but I haven't seen it posted in quite a while.

it sure would be nice if gravity and electrostatics were the same
force, would make it easy to build antigravity device, just hook up a
van de graf generator and fly away!!!  you really are digging up some
old and incorrect theories from long ago... keep digging and you'll
get back to the 4 basic elements, then you will know everything.

Moon dust fly away.
On the Earth the soap-bubble levitates if are charged.
Earth and Moon have the excess of electrons.

In the history are the reasons for which Maxwell did the hipothesis and and why it was discarded.
Not as a whole. The math for solid body is in using. In a solid body are stress and strains.

In the history no the school version by Heaviside. It is only in your "real world" and in textbooks.
S*

Well, that certainly allows "the little guy" to view the code and extract the important parameters, math and formulas so that they can construct their own specialized tools! Just a bit of understanding how math is defined by a computer language and you are good-to-go.

Regards,
JS

More babbling word salad.

Seek medical help.

DANGER WILL ROBINSON!!! a 'bit of understanding' in this case could
lead to totally incorrect results. be sure you thoroughly understand
the limitations of the 'thin polygonal wire' model and any earth model
they are using. it is likely this will have lots of undocumented
limitations. also i worry about their claim of comparing to other
freeware results, do they only build models for comparison that are
well represented in both tools? and do they understand the
limitations of what they are comparing to?

One wonders why they converted Richmond's older code rather than NEC2.
Both are available as FORTRAN source.  Even NEC4 source is readily
available these days, although not for free (so it wouldn't necessarily
meet their FLOSS objective.. I'm not sure.. they wouldn't be copying it,
they'd be converting it, by hand, to C++, and I think that would break
the "proprietary" link)
```

Maybe Richmond's code does insulation? or wires in a conductive medium?

```

the proprietaryness(is that a word?) or the copyright status may not
be broken by changing language if the algorithms are claimed as the
actual intellectual property... the code is just an implementation of
it, no matter what the language.  There would be no need to convert
the fortran anyway, there are still fortran compilers available and
you could call the fortran computations from any language gui front
end.  i'm doing a project like that now that calls old fortran, c, c+
+, or pascal computation modules from a new c# front end.

I would be really surprised if you could patent math formulas, equations, etc. The software which uses them can, obviously, be patented. Something with is "self-intuitive" or a law of nature just can't be patented!

Regards,
JS

what is intuitive to you is a patented or copyrighted work from a lawyer's point of view. while you can't patent or copyright maxwell's equations you can patent or copyright a method of applying them to come up with solutions to practical problems. these are common things now in the software and business world, though some countries have stopped issuing software patents and others are considering that move also. but the copyright process is well ingrained in the software world. So much so that there are specific copyright notices you can use to specify that you DON'T want to stop anyone from using your code, just so you don't get bothered by people asking all the time.

I am not arguing the obvious, just that Tesla was a genius before his
time. Edison had some creativity but mostly stole other people's
inventions and made them work for commercially viable products.
He wanted to distribute DC power but Tesla wanted nothing to do with it
so he became allied with Western House who knew that AC motors were the
way to go. Since Edison went with D.C. and then found out it was only
good at the local level he lost out. It took years but we can all see
the effects by looking at those million volt transmission towers. I
climbed one about 15 years ago and all I could hear was the crackling
around me. Let Edison try to convert DC at that level.

I only commented on Tesla being a world smarter than Edison and did not
intend to start an off topic war. P.S. Philo T. Farnsworth invented
television, not RCA, who just ripped him off.

I don't think that's what's claimed by Lawrence Livermore Lab.. the code is copyrighted, and the license agreement (I don't have it here in front of me, so I'm working off memory) basically says you can't redistribute the code. The algorithms have all been described elsewhere.

the code is just an implementation of
> it, no matter what the language. There would be no need to convert
> the fortran anyway, there are still fortran compilers available and
> you could call the fortran computations from any language gui front

> +, or pascal computation modules from a new c# front end.

I did wonder why the authors bothered to convert from FORTRAN to C++... but I think they did that as a separate activity, previously, for other reasons. There's a comment in their paper about not using automated translators, too (presumably to avoid any sort of claim that the output of the translator is somehow contaminated with the proprietaryness of the translator? Kind of like Intel copyrighting the assembler instruction mnemonics for the 8080, so Zilog had to use different ones)

```
Probably it's just a historical artifact.. when they started their
development a while ago, they happened to start with the Richmond code,
as opposed to the Burke and Poggio code.

I had a 10 foot horizon to horizon Zenith dish and not only did I catch
news anchors picking their noses but got a lot of shows a week before
they were on regular TV. That was 1990 time frame, so much must have
changed by now. I did pick up purely digital signals which were
```

```
detectable as byte length dots and dashes (1's and 0's) but never
recorded one. I have to wonder what those were. Now, in 2010 it may be a
bit of an antique but I will bet there is still some interesting stuff
going around.

You are a godsend to the hardware manufacturers, they love you!

My TV, radio, stereo, MP3 player, DVD recorder/player, etc. all travel in my briefcase as USB Dongles or software. That size fits me well! ROFLOL

To each his/her own,
regards,
JS

If it is easy to observe then you should be able to observe the effect
yourself.

What have you seen?

t

But if as was suggested the computer is the TV and is the telephone
and is the ... abstractly they are all one device.

- quote -
Isn't it about time we stopped buy a seperate TV, radio, phone,
stereo, etc. A computer with the proper software and attachment(s)
are all of these and more (all these, except for phone, are available
on ebay.)
- end quote -

Literally by both connection and dependency they all become one
device. No USB device is especially useful without a computer's USB
port.

> But, if the case is you and the wife can't afford seperate
>hand-helds/netbooks, well, get a better job!
>

It's a functionality question not a financial question. Should a
second computer with all the USB peripherals be required just so
Mike's Mrs. can use the telephone while he watches television? Being
able to do something doesn't validate its worth. Using USB devices for
the sake of using USB devices gains no efficiencies.

>> It's for the same reason that I don't want to keep my frozen meat in my

Is this discussion about appliances with limited functionality such as
"palm-top/ereader/netbook" or a fully functional computer? How well do
the USB devices mentioned below work within the
"palm-top/ereader/netbook" trifeca?

>not a printer, but an external printer hooked up workes just fine. My

Yourself as well, your USB spell-checker doesn't appear working
properly ;)

Your initial post alluded to convergence but all you're doing is daisy
chaining peripheral devices. The only visible difference between now
and ten years ago is the number and types of available USB devices.

All those peripherals may work well together until disk, bus and/or
processor activity becomes intensive. Regardless of optimism there are
always limitations.

>> They kind of remind me of the Escalade SUV/Pickup trucks. Horrible

>
You missed the point and taking a second cheap shot won't help you
find it. The Escalade is an analogy about multi-purpose devices in
general, not about using a computer as a multi-purpose device.

If you've never seen wheels, steering wheel, gearshift, headlights,
etc. on a computer you haven't looked at today's passenger vehicles.
There's more processor power there than on/under your desk.

Pure conjecture. Mike's post provides no insights concerning his use
or non-use of USB devices. For all you know his computer might be
surrounded by cluster of USB devices.

I have not any possibility or opportunity.
Years ago I asked about the frequency doubling. The second answer was:
Luxembourg efect. It was this what I was
looking for.

But next were two hundred post with word salad on me and non-linear effects.

With the "polarisation" was the same.
So I know that sooner or later appear the valuable information.

Michael wrote: "Is it to be expected in highly efficent antennas, or just
inneficient ones in which there is substantial heating already? "

Lodge has seen the glow. You use the LED and VSWR..

Now everybody from you can measure the electron emission and heat emission.
I was expected that you (radio people) know the results.

No heat only in superconductors. In gold is lower than in aluminium.

Of course. The antennas on animalls have temperature rise below 15C.

I do not know. I am asking you (antenna owners).
Working antenna is hotter than at rest. Which part of the dipole is the hottest?

Why would that be when you are the one purchasing multiple USB
accessories to fulfill your supposed all-in-one vision.

>My TV, radio, stereo, MP3 player, DVD recorder/player, etc. all travel
>in my briefcase as USB Dongles or software. That size fits me well!  ROFLOL
>
It sounds like you're describing my 3 y.o. laptop that has all that
hardware built-in. To use the box and all the devices it is simply a
matter of booting up. There is no need to unpack and connect a bunch
of peripherals. When done I can close the lid and go w/o the need to
disconnect and re-pack a bunch of peripherals. It's much closer to
being an all-in-one device than your box with all its external
accessories.

You might want to refrain from using the term 'USB dongle' to describe
anything that plugs into a USB port.

So how does your Television/radio/phone/stereo work exactly? If a person
using the phone at the same time as another person trying to watch TV
and another wanting to listen to music isn't going to conflict, I'm not
sure what will. You be the one that suggested we should be buying
singular devices and plug dongles into them.

Hmm, I have to imagine you're deliberately missing that analogy.

As you will. My purpose built hardware has one huge advantage. A lot of people have a whole lot of trouble keeping their computers running. I spend a lot of time as my friends and family's Tech support guy.

Explain how having a PC, with all it's security issues and other problems, like updates that knock it out of commission, is going to be a superior alternative to a television that you turn on, or a phone you pick up and use. When your computer is zombified or halted due to all the spyware on it, it will take down everything that is attached to it. After that, we have to worry about turning our Televisions, which at this time have a 15 year lifespan, into the 3 or 4 year lifespan of PC's. I can just see children waiting patiently while Dad reformats and reinstalls the system software because the computer got hosed and no one is getting anything on the television.

So people are going to have to become IT weenies so they can watch TV? Good luck with that one.

Whoosh. Another analogy about devices that try to be more than one thing. A television is not a telephone is not a cell phone is not a stereo system. One could be pressed into service as all of the above, and at the same time - but it takes a pretty good argument to say it will perform as well as the separate devices.

Have got no idea how you got the idea that I don't use USB devices.

I use 'em by the ton. My computer controls my radio via Ham Radio
Deluxe. I use DM-780 for my digital modes. The computer control of the
radio takes place over a USB to serial Dongle. I also have a TinyTracker
interface via another USB to Serial dongle. It works pretty well. But
I'd never dream of plugging a MagicJack or watching Hulu on it. I have
other computers for that stuff.

Not only would performance drop off, but there would be useage conflicts
also. Right now, I can watch Television on my TV, while reading email on
  one of my computers, while carrying on a PPSK31 QSO with the rig
control computer. Heck I could carry on a simultaneous conversation via
phone too, I guess.

Much more difficult to do all the above if I was using all in one operation.

Pure tripe, and too obvious to respond to.  The cry of desperation in
all the verbiage is deafening.

If you missed it, read my first post over, a few times ...

Well then, sounds like you are on the right track, headed in the right direction. It just takes some a bit longer than others. I am sure you will get it right ... eventually. Anyway, will give you something to do while we are waiting for a software controlled cell phone to be developed. But like I say, it probably won't happen until enough people become "electronic literate" enough to demand them.

Yeah, I can see how you would have a lot of time figuring that out. It is done with multiple computers. Home entertainment systems is run off a desktop. Portable stuff done around the home is done on a laptop. Stuff in a hotel room is done on one of the travel netbook/laptops. However, I frequently have the tv in a corner of my screen, muted, an MP3 playing though USB wireless headphones, a call going over skype or another such application, and the software defined (SDR) radio monitoring, etc. So the conflicts you keep coming up with are just unknown here. Perhaps you are just one of those people who can only do one thing at a time?

Yeah, that is a real pain. You do have to learn to properly use/maintain a computer. I am always amazed at the amount of people standing around calling a tech for some simple "plug it in" answer to fix it. Usually, these are the first to tell you about all the technically complex stuff they are doing on their computer, like your text here starts off, then you find out it usually set non-functional in a corner with them afraid to touch it, in fear of messing it up, ROFLOL.

The above just proposes a lot of problems which don't exist in my world. My computers run rock solid. If a kid messes with a control, or causes a problem in the software, I just fix it. Obviously, you need a computer course, or two, or three, ... and knowledge in the correct operation of computers. I use Avast free anti-virus. McAfee, Norton, etc. are just too buggy--there is a problem with these products. Microsoft defender is an excellent addition to this.

That is just a blatantly stupid remark. The computer was meant to do all this and much, much more. It is that single-device-single-function mentality which manufacturers have hired madison avenue ad men to sell you at work.

Well, you whole texts are confusing.  They are written around a logic
which defies translation!

No, you are simply trapped by your own world. You need to look beyond
to what other people are actually saying and using.

>
> You might want to refrain from using the term 'USB dongle' to describe

That is exactly what they were, have always been, and still are. The
term was coined back in the early 70's and used to be applied to
differing externals plugged in to differing ports of a computer. I
guess you learn something new everyday.

John Smith wrote:

>
> Well, you whole texts are confusing. They are written around a logic
> which defies translation!

Well, JS. Why don't you design and implement this system. You don't like
my logic, and I am "wrong". I say it won't work, and gave my reasons.
Prove me wrong. Along the way, you'll become the richest man in the world.

I say people have enough trouble with their computers already to have everything they own running on one. Because it won't be running. There is no reason to believe that this setup you propose will be any more reliable than what is already out there, and not being reliable now.

It isn't vision, it isn't being a Luddite, it's just that it isn't practical. My Television is already accessing the internet. It's doing it via software that isn't Microsoft Windows based, and avoids all the vulnerabilities that platform has. My Telephone is IP based, and the same for that. It works, it's not Windows. The weak point of my entire home communication system is the computer internet access. And if you don't have any trouble, you're one of the few. My Linux machine doesn't have any particular problems, my Mac runs bareback. My Windows PC has to be locked down like Fort knox. It's hard to imagine giving up my presently operating systems to migrate to the weakest link of the chain.

But by all means, have at it. Remember us little folk.

My favorite part about Windows users is when I note a problem, they say "Gee, I've never had a problem with my machine - it works flawlessly. THen they start to tell me about the time a virus got into their machine, and they ended up reformatting the drive and reinstalling Windows, and the time they got their DLL's messed up and ended up reformatting the drive and reinstalling Windows, and the time their machine was zombified and they ended up reformatting the drive but it was rootkitted and they have to reformat again, and then figured out they had a problem in the BIOS. But they've never had a problem.

Even those who have a running computer don't know exactly what's on it.

I deal with repairing this stuff every day, and I have to tell ya, there are a lot of intelligent people that for whatever reason, can't keep their computers running.

Anyhow, have fun, no use of you arguing with the great unwashed like myself.

After VAX boxes and other minicomputers appeared, many types of
commercial productivity applications besides CAD tool relied on
dongles as security devices. As computers moved to the desktop this
did not change. There was even a C-64 accounting application that
required a dongle. It was primitive but effective security.

>This is much the same as the term "Computer

Not quite. Journalism isn't the only field where hack writers can be
found. Quick and dirty code is often referred to by the author as a
being a quick hack. It's an acknowledgement that the code is not
particularly elegant or robust, just a temporary solution to resolve
an issue or answer a question.

If a computer professional describes them self as a hacker today
(without using the word hat), it's an admission their skills and
training could be better. Calling any computer professional a hack is
a insult.

Actually we do. You, who believe the 200 and 100 year old myths, don't believe us. And then you prattle on about us not knowing of what we speak when it is you who do not.

I did no such thing. Make a computer a cell phone ... or any damn other
thing you wish. USB dongles are the quickest/cheapest route.

It takes too much time to keep correcting your errors in text, thinking,
etc. Go play with someone else not ...

Regards,
JS

Tesla wrote in XX century that EM is a myth. I simply agree with him.
Tell me then who know better how the radio works: Tesla or you?

If the junction with the transmission line is poor.

As you see I cannot accept your answer because it do not fit to Tesla's
radio. So the next question:

The simplest dipole is made from a transmission cable. It is enough to
stretch the wires in the oppsite directions (like arms).
The no junctions.

Which part is the hottest?:
-Transmission cable,
-The first part of the arm,
-The end of the arm.

And yet you come down to grace us lowlife with your wisdom, looking for all the world like an anonymous Troll. You don't get the recognition you deserve, John.

How come you're not using your superior skills to implement this system?

You "do" all languages huh? Maybe I should be impressed but I'm not.
Reeling off a list of programming languages (with one mis-spelled)
says little about depth of knowledge and corresponding skillsets. The
list does suggest most if not all of what you do involves procedural
programming.

Once again you make grand assumptions, your little circle is correct
and everyone else is wrong, wrong, wrong. AFA working with a bunch of
doctorates, what should be inferred? Both the top and bottom of a
graduating class get the same piece of paper. All the document means
is the course of study has been successfully completed, nothing more.

Funny thing, the written record appears to disagree.

>Make a computer a cell phone ... or any damn other
>thing you wish. USB dongles are the quickest/cheapest route.
>

Re-read what you've written previously and consider the differences
between the "is a" and "has a" relationships.

>It takes too much time to keep correcting your errors in text, thinking,
>etc. Go play with someone else not ...
>

Like where I wrote the term dongle was coined in the early seventies
and existed before CAD applications? Oh wait you wrote that and I
pointed out that the generally-acknowledged first CAD application was

produced in the early sixties.

I'll give up and will concede that you are indeed a hack programmer.
Wear the title well.

Babbling nonsense and shows you have no clue as to the meaning of voltage,
current, and power.

> As you see I cannot accept your answer because it do not fit to Tesla's
> radio. So the next question:

No, you can't accept the answer because it doesn't fit your demented
preconceptions.

Tesla died insane a long time ago.

The above is just babbling word salad and the question has been answered,
whether you like the answer or not.

Anybody with experience with this antenna? It appears to be a quasi-vertical dipole with two "radials" attached to the bottom end and fed at the bottom. At least this appears to be the case; I could be wrong.

What issues arise when feeding a dipole at one end (the bottom in this case)? This can't be a truly balanced design, can it?

Most likely, it is something similar to this:
http://www.earchi.org/pdf/ENDFED.pdf

Pick up a reasonable matchbox, or build your own, use with the above
80-10m. I'd be surprised if what he has warrants the expense.

Regards,
JS

i know better than whatever you think you understand of tesla's work,
and also have at least 60 years of research after he died to support
it. the first part of the arm is hottest, just like the center part
of the dipole that is not heated due to a bad connection... maybe you
make bad connections to dipoles, i don't!

I just got a TH-F6A and have been reading about the weakness of the SMA connector. I'm convinced I need to get an SMA-BNC adapter but I have found no BNC HT triband antennas. Are there any out there?

The Smiley 270A is a dual band 2M/440, but they claim it will also work on 440? Any experience with that?

Also, I have been thinking about Gulyas http://www.wa3hrl.com/smabnc/ SMA-BNC adapter in particular, but then I read this article
http://osdir.com/ml/recreation.radio.hardware.kenwood.th-f6a/2008-01/msg00041.html
It says: "To minimize the stress on the HT, I use the slick little adapter BGA-80 from Steve Gulyas. It uses a special o-ring arrangement that minimizes leverage against the SMA. Works pretty well. Its the best on performance, but too big to be attached to the HT when worn on the belt."

Does anyone have any experience with SMC-BNC adapters? Do any good ones allow you to attach your HT youir belt?

I'd really appreciate any suggestions you may have!

Patty

I hate to break in on private arguments, but Tesla was one of the
smartest people to ever walk this earth. Are You?
He invented Radio, but Marconi took the credit, using at least 6 of
Tesla's patents.
I can rant on Edison and Daguerre, but that gets long.
Some of you guys need a 'TRUE' history lesson.

Bill Baka, Listener only, since I rent these days.
Had a 1st Class Radiotelephone with Marine RADAR, P1-12-24966,
but gave it up some years back when they decided to do away with the
first class distinction.

Different numbers, but hard work to get anyway.

I was specifically responding to the part where it is claimed that Tesla
said EM is a myth.  I feel quite safe, thanks.

But I wouldn't have debated alternating current motors with Tesla.  No sir.

Just noticed the renter part.

I've been renting for 35 years and haven't been too seriously
constrained for most of it. And by not seriously constrained I mean 4

over 4 yagis at 25 and 37 feet with 1000 watts on 6m amongst other things.

If you work with your landlord you can often get permission for a lot.
And the right city helps, too.

tom

Nikola Tesla wrote: " I showed that the universal medium is a gaseous body in which only longitudinal pulses can be propagated, involving alternating compressions and expansions similar to those produced by sound waves in the air. Thus, a wireless transmitter does not propagate Hertz waves, which are a myth, but sound waves in the ether, behaving in every respect like those in the air, except that, owing to the great elastic force and extremely small density of the medium, their speed is that of light."

Bill Baka wrote: "Some of you guys need a 'TRUE' history lesson."

There is also wrote that EM wrote Heaviside not Maxwell.
Maxwell's hypothesis was quite different. There were the molecullar magnetic vortices. Inside the solenoid were millions of them. They rotate the polarisation plane. What rotate it in Heaviside EM? Inside the solenoid is the flux. Any rotation.
In our textbooks is wrote "whats a pity that to teaching was choosen Heaviside not Ampere".
But Ampere is too sophisticated for students.

So, "I feel quite safe, thanks."

maybe in your 19th century text books, mine has plenty of Ampere in it. you must remember, those guys were working things out as they went along, their early writings were likely replaced by later ones that changed with improved observations that disproved what they thought at first. and then many things changed after the michaelson-morley experiment dispelled the last believers in aether. so unless you are studying things after that you are likely reading outdated and well disproved early theories.

And close to 100 years worth of experimental testing say Tesla was wrong, get
over it.

```

of the dipole that is not heated due to a bad connection... maybe you
make bad connections to dipoles, i don't!

Michaels answer was the best: "Aside from analysis, has anyone measured this
effect?

Is it to be expected in highly efficent antennas, or just inneficient
ones in which there is substantial heating already?

I have found that ice (hoar-frost) and rain do not disturbs radiating. But
the ice-water strongly. The ice-water is in a moment when the hoar-frost is
melting and in the pores is water (normally is air).

It is agreement with: " "In fact, most dipolar solids exhibit extremely
small dielectric losses since W tends to be extremely large. Water-free ice,
for example does not heat significantly under microwave irradiation."

I have found also that the temperature is measured for antennas for
annimals. The temperature rise must be below 15C. Of course they know the
details.

So no additional questions from me.

I've run plenty of base fed half waves, but never saw a need for
two lower elements.. You can't really call them radials in that case.
They have nothing to do with lowering ground loss.
But it's hard to tell, being I've never seen the antenna.
But if I were base feeding a half wave, I would not bother
with two lower elements spread apart. No real point in it.
The main difference in feeding at the base vs feeding in
the center is impedance. A much higher Z when base fed,
so you need a matching device. And for that I usually
prefer a single turn coil and a coax capacitor. Some have
called this a "gamma loop" matching device, which is
fairly close I suppose being as you tap the single turn
coil at the point of best match, much like the usual gamma
match. Truly balanced? Nope.. But that really doesn't
mean much. Even a center fed half wave can have common
mode problems. So it's not like that method of feeding cures
all feed line radiation problems.
They will both require decoupling sections for optimum
performance. But saying that, you can often run a half wave
with no real decoupling and have decent results.
It will vary to each installation.

Much of it is also available as streaming internet video.
Free video players are widely available. So, why invest
in the TVRO equiptment.

I like the Wi-Fi DX idea for the dish.

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been
recently revived by an active moderation team.  We are currently seeking
suitable information, FAQ, and bulletin articles from the entire
rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our
newsgroup.

We are seeking a replacement maintainer for the following information
bulletin formerly posted to rec.radio.amateur.* (and currently archived
at http://www.faqs.org/faqs/radio/personal-intro/ ):

 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article      |
is that it does not mention newer amateur radio newsgroups created since     |
it was written, including:                                                   |

 rec.radio.amateur.antenna                                                   |
 rec.radio.amateur.boatanchors                                               |
 rec.radio.amateur.dx                                                        |
```

rec.radio.amateur.equipment |

it.  you must remember, those guys were working things out as they
went along, their early writings were likely replaced by later ones
that changed with improved observations that disproved what they
thought at first.

Ampere, Gauss, Weber, Maxwell are too difficult for student.

> and then many things changed after the michaelson-
morley experiment dispelled the last believers in aether.

MMX proved that no motionless solid ether. Such was necessary for the
transverse waves.

> so unless
you are studying things after that you are likely reading outdated and
well disproved early theories.

Now is the plasma physics: "Waves in plasmas can be classified as
electromagnetic or electrostatic according to whether or not there is an
oscillating magnetic field. Applying Faraday's law of induction to plane
waves, we find , implying that an electrostatic wave must be purely
longitudinal. An electromagnetic wave, in contrast, must have a transverse
component, but may also be partially longitudinal"

For Tesla ether is: "but sound waves in the ether, behaving in every respect
like those
> in the air, except that, owing to the great elastic force and extremely
> small density of the medium, their speed is that of light."
```

For Dirac it was an electrons see.

Now we know that in the electron see are the positive ions, So the plasma is neutral.

As you see people step by step go ahead. Only you are standing in the Heaviside's water (hydraulic analogy).

Tesla like Ampere are not in the teaching program.
Teaching programs are written by Ministry of Education.
Not all is in the teaching programs.

Up to now I have never seen opinion that Ampere and Tesla was wrong.
Remember that all scientists discard the Maxwell's hypothesis.

Heavisde made the EM.:
http://en.wikisource.org/wiki/Electromagnetic_effects_of_a_moving_charge
But he wrote: " I must, however, disagree with Prof. Thomson's assumption

that the motion must be irrotational. It would appear, by the above, that
this limitation is unnecessary."

The magnetic whirl was born. Teachers like it. They can write divrot H = 0.
It seems that you also like it.

they are not hard they are the basis of teaching modern
electromagnetics.  Any introductory electromagnetics course uses their
stuff.  if they are too hard for you that explains why you have all
those strange ideas, you are stuck 100 years ago with outdated over
simplified theories that have been disproved many times.

Hi Roger, I received a nice hi-res scan of the antenna in my email. It
is much easier to read than the pdf file. This one that I have is the
jr model. It is now called the TH3jrs. Thanks for the info and 73,
Randy, w5kcm

The radio waves.
Do you agree with Jim: "Insulated antennas work just fine."?

"Just fine" may means enough.
But I am interesting in: "What is better: bare metal or insulated metal?"

May be that more water bigger "distance surrounding the object".

All this is fascinating, especially with presence of water.

All this phenomenon occur at higher voltages. In normal transmissing no such
spectacular glows but only simple field emission.

In textbooks is wrote that the electron emission is more effective than the
absorption and that the glow is different.

Do you know how is the netto flow (field emission/absorbtion) of electrons
during transmitting?

In regards to radiating RF energy, the only difference insulation makes is the elements are slightly shorter due to the change in velocity factor.

Insulation makes an antenna heavier, can reduce corrosion, and can allow you to have whatever color antenna you want.

So define "better".

If you mean work as an antenna, there is no difference.

You are a babbling idiot.

If the insulation is infinitely thick, there is no outside of the insulation
where radiation can occur.

But, yes, there will be radiation inside the insulation.

And yes there is radiation in the air as I said above but the air is not
infinitely thick.

Like vacuum. But there are ions and free electrons.
In solid and liquid insulators no free electrons.

Does solid insulation makes the radiation weaker or stop it?

Glass is an insulator but it is transparent for the light frequencies.

Does exist an insulation (reasonably thick) which is not transparent for the
radio-amateur frequencies?

You obviously do not know that the amateur frequencies start at 1.8 MHz
and include everything above 300 GHz.

Within that range of frequencies, there are lots of materials that are "insulators" that have large dielectric losses.

See:

http://en.wikipedia.org/wiki/Permittivity

and in particular:

http://en.wikipedia.org/wiki/Permittivity#Lossy_medium

You are a babbling idiot.

I think I see where you're going with this Richard, but you must realize
by now that you're talking to a rock.

To put it another way, he wouldn't pass the Turing Test.

Interesting, thanks.

That is similar to some of the new systems that let you store encrypted
data and perform operations on them without decrypting them or knowing
what you've done.

tom

A couple years back, (after I had the system pretty well finished) we had one of those multiple strikes. It hit the power line out front, but neither I nor my neighbor directly across the road had any problems. However the neighbor to the North of him lost a lot of equipment. To that South of that neighbor across the road is a vacant lot that *had* a pine tree at the back of the lot. That tree literally exploded. All that was left of a 50 foot tree was a a 4' stump and a LOT of splinters. Well there was one piece about 4' long (give or take) stuck into the ground about 60 feet out. Thing is, only a little of it was sticking out of the ground. That thing must have had a LOT of force behind it.

73

" For frequencies at which dipole orientations cannot follow the applied
field due to the viscosity of the medium, absorption of the field's energy
leads to energy dissipation"

> You are a babbling idiot.

I am collecting evidences. Thanks for your input.

So, next question:

The "energy dissipation" means heat.

In case of the bare wire the air is heated. For isolated the insulation.
Is it possible to burn off an insulation which have large dielectric losses?
S*

I suppose yes, if the loss is high enough, and the applied power is high enough. However, a dielectric that lossy would greatly effect the electrical length of the antenna element, and removing it would change the characteristics and impedance of the antenna, so it may totally change the way your antenna behaves.

ello,

Am in my 70's now, and frankly not all that sharp with antennas.
I figured someone here might be able to help me out.

Live about 25 miles due west of Boston.

Have an old fashioned analog TV in the kitchen (not on cable)
that this question relates to.

Some time ago, as you know, all the TV stations required one to get
a Converter box. Did so, and am using it with an old fashioned,
el-cheapo indoor antenna; the one with the rabbit ears, and a loop.

The Converter box feeds my analog TV.

Works "fairly well," but lots and lots of dropped signals.
Makes listening very unpleasant.

It has been recommended that I purchase a:
DB-2 antenna for about $ 35.00

This is shown in (please take a look):

HDTV Antennas

http://www.antennasdirect.com/store/DB2_antenna.html?pconf=55&slot=68

http://www.antennasdirect.com/store/pconf.php?productid=55DB2

Questions:

a. Are these new, converted, stations now transmitting in the vhf or
uhf ?

e.g., am I after a new, better, vhf or a uhf antenna ?

b. Do you think that this DB-2 would be worth trying ?

Any thoughts would be most appreciated.

Thanks,
Bob

Bob,

Except for a few low power or educational stations you just need a UHF antenna, and the DB-2 looks like a good choice.

Hello Bob,
I understand the age reference, I turned 70 in April.

The antenna you are looking at is a tried and true UHF Bow Tie. It is definitely better than rabbit ears. However, it is pretty bulky for indoor use. Since you are getting a poor picture now, I would guess that it is likely that this would do the job. The twin lead wire that they offer is lower loss than the coax cable. The twin lead also allows a old fashioned tuning trick: Wrap a small piece of aluminum foil around the twin lead and slide it around for the best signal. That might help your existing Rabbit ears as well!

A better Bow tie can be fashioned from hardware cloth (tighter mesh) and wire. The dimensions are not very critical and if it is to be used inside weather proofing is not a concern. Think in terms of tape, foil any kind of wire. Clothes hanger wire is usually handy.

Thanks for the reminder, I need to try a couple of long dormant ideas!

Yeah, so what?

You do understand that they are referring to the molecular dipoles in the
insulator, don't you?

>> You are a babbling idiot.
>
> I am collecting evidences. Thanks for your input.

Evidences (sic) of what, that you are a babbling idiot?

> So, next question:
>
> The "energy dissipation" means heat.

Of course.

> In case of the bare wire the air is heated.

Nope.

This just shows you have no idea what permittivity and conductivity mean and you haven't a clue what you are babbing about.

> For isolated the insulation.
> Is it possible to burn off an insulation which have large dielectric losses?
> S*

If you had the slightest understanding of the very first equation of the referenced link and the text that follows, you would know the answer is yes.

Since you apparently read the link and still asked the question, I can only conclude you are an idiot.

Hi Bob,

Good starting point.

>Works "fairly well," but lots and lots of dropped signals.
>Makes listening very unpleasant.

Only means you need to move your existing antenna HIGHER.

>It has been recommended that I purchase a:
>DB-2 antenna for about $ 35.00

If you want to spend $35 and mount it HIGHER, you can do that too. [The implication here is you will probably need an external set-up any way you look at it.]

If your rabbit ears need to be turned to capture the best signal, then you may need to do this second option. Don't forget the expense of a mast and cable/wire to go between things. If you still need to turn the antenna, then you need a proper rotor and mast (with a bolt to the side-of-the-house kit). Somehow, given your location I would suspect all the major broadcasters would be on the same general beam heading.

Getting the antenna (whatever you choose) higher recovers from a lot of ills.

As you know I do not understand why in XXI century most scientists use the
hydraulic analogy.
Permittivity and polarisation are from the hydraulic analogy.
Now conductivity and electrostriction should be used.

Bob-

It depends on where you are. There is a web site that has that information, along with pointing information from your location. I just can't recall the URL due to Old Age!

I think we all are experiencing the same problem with HDTV, regardless of whether we have a converter box or an HD set. Unless you happen to be close to the transmitter site(s), you probably need an outdoor antenna, as others have suggested. I'm using a simple attic-mounted VHF/UHF antenna with an amplifier, but still have dropouts when a low-flying airplane passes.

I just found the URL listed on the plot for my local TV stations as: <http://www.tvfool.com>.

Hi Guys,

Just a quick thanks for all the really good info.
Nice of you all to take the time; appreciate it.

BTW: That DB-2 I mentioned is really large for anywhere but an attic.
Didn't realize the dimensions of the thing.

The rabbit ears we now have are on the top of our fridge, and not too
obvious. Running a wire from the attic may not be practical, for now.

Any suggestions on anything possibly worthwhile to try, smaller than the
DB-2 ?

Thanks again,
Bob

For a variety of reasons I have to place a roof tv antenna smack in
the middle of my roof and the ground wire has to run the most direct
course straight of the roof and straight down to the grounding rod.
the coax however has to run across the roof in a different direction
to the service entrance where it will be run through a grounding
block. So there will be 2 separate grounding rods sparated by about
60 feet. Will this cause anything like a ground loop??? Does anyone
know if this is code to have 2 different ground rods?? thanks for any
help. jk

Hi Bob,

FIRST, your objective should be height, the ability to "see" the city (or, more specifically, the transmit towers: consult the other posters on how to locate them).

SECONDLY, you select the antenna that does the job. As your rabbit ears nearly work, they might fully work up on high.

THIRDLY, how high is a matter of many practical issues. Hence the suggestions for attic locations by others. This is an easy first test that costs no more than the length of cable/wire necessary to go there. You will need the cable/wire anyway.

FOURTHLY, if your antenna at the desired height doesn't work (which, in effect, is your original complaint), then throw money at it in the form of amplifier, antenna, mast, mounting hardware, and rotator (you never revealed how up to speed you are in knowing where your broadcasters are).

It will cost more doing it in the expensive order (buying the antenna first, and possibly a second one when the first doesn't work, etc.).

I don't know what the code in your area would require, but the two grounds in my area are required to be connected together and to the house ground and to the cold water pipes. The idea is not to have anything at a different potential when struck by lighting. If everything is at the potential, nothing will be damaged or that is what is supposed to happen. In my case my tower is 65 feet from my ham shack. The tower is grounded with a ground rod to each tower leg. The feed-lines run into the shack in a buried 4" plastic conduit. Along the outside of it is a #6 copper wire connected to the tower which is ground along it's length with 4 more ground rods. The #6 wire comes into the house and crosses across the house to the entranced panel were it connects to the entrance panel ground and along the way connects to the copper panel were the lighting arrestors for the coax are located. The code inspectors loved it. I would think that a wire from the ground rod that is connected to mast to the entrance panel and to the house electrical panel ground would be the thing for you to do. And no there is no problem with ground loops. This ground is for lighting protection only and is of no use for RF ground an it has too high of an impedance for RF.

Hi Dick,

Really good suggestions.
Thanks.

BTW: Re the rabbit ears and the loop on my present antenna:

Which is for vhf and which for the uhf channels ?

Thanks again, and for all the past help,
(and everyone's else)

Bob

Hi Bob,

The ears are for VHF, the loop is for UHF. Neither are critically adjusted - aside from your effort on the ears; and even there, few choose or find "classic" lengths. If I am to guess correctly (by inference of your old TV/antenna), then I would say you were reasonably served by the Boston channels in the past. This suggests that you are probably just on the fringe of the newer technology's lower power transmission.

The antenna you have now is not suited for outdoor environment (you could probably guess this). However, if you first invest in a suitably long enough cable/wire and go outside with it mounted on a

broom stick and climb a ladder to do a survey around and about, then
this will give you a first-pass guesstimate of how much effort you
will need to put into this project. This test will lack in stability
of position, and the ability to trim the lengths of the rabbit ears,
but I bet it will give you enough information.

Electrostriction is a new. The "" For frequencies at which dipole
orientations cannot follow the applied  field "
is rather old.
Do not stay in Heaviside water.

i kind of like the idea of heaviside water... he must be carrying the
water for heaviside.  i wonder if he even knows what electrostriction
really is?

That babbling idiot hasn't a clue what ANYTHING really is.

If you read sci.physics.electromag you will find lots of his gibberish.

Twenty average members of the public were asked what they thought of
radio amateurs:

9 said amateurs were the cause of interference.
3 thought amateurs were nut cases.
5 said amateurs were odd but harmless.
3 had never heard of radio amateurs.

Five top people in the electronics world were asked their opinion:

3 would not employ radio amateurs in their organisation.
1 had heard amateurs on air and opined that they spoke a load of tripe.
1 said that most technical blokes talked a load of tripe anyway.
1 said he would employ an amateur if qualified for the job.

That was in 1965, so not much changes or does it?

Charlie.

If you think that's bad, you should see what they say about people who
cite bogus surveys on the newsgroups!

Ha ha,

Not bogus thought but from the April 1965 edition of the Short Wave
Magazine but I did post it to the wrong group!

Charlie.

water for heaviside. i wonder if he even knows what electrostriction
really is?

It is not the dipole orientation (rotation). It is the deformation of the
dielectric.

"In fact, most dipolar solids exhibit extremely small dielectric losses
since W tends to be extremely large. Water-free ice, for example does not
heat significantly under microwave irradiation." From:
http://www.tan-delta.com/mw_heating.html

Water droplets are strongly deformed in a weak electric field.
Do not stay in the Heaviside water. There the two electric fluids were
displaced. No deformation of shape.

Now many scientists analise the electrostriction.

"Quartz glass has a very high dielectric strength but a very low electric
conductivity, even at high temperature, high voltage and high frequency,
nearly without electric loss in the range of the frequencies applied.
Therefore quartz glass is an excellent high temperature dielectric
material."

What is the cause: polarisation or electrostriction or the both?

Being able to cut and paste from a web page doesn't mean you are not a
babbling idiot.

I wish he would talk to art more, the two of them are more fun when
they are combining their gibberish.  i guess they just don't realize
that the technobabble they have come up with doesn't really mean
anything useful, and little pieces of knowledge taken out of context
just can't be strung back together in any order to prove something
they think is right.

so which of these do you think may apply to Mr. B or Art? Could be
just about any of them i guess, though art seems to alternate between
Logorrhea and silence, maybe he's bipolar? Mr. B seems to be solidly
Schizophasiac, just continual nonsensical babbling.

Wernicke's aphasia
Schizophasia, a mental condition characterized by incoherent
babbling (compulsive or intentional, but nonsensical)
Logorrhea (psychology), a mental condition characterized by
excessive talking (coherent or otherwise, but compulsive)

I believe Art has early onset alzheimer's disease, which I find very sad,
while the other guy is just plain bat shit crazy.

Posted-By: auto-faq 3.3.2 beta (PGPMoose V2.0, Perl 5.005)
Archive-name: radio/ham-radio/moderated/crossposting
Revision: 1.1 2009/04/12 19:42:04
Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including

uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to
rec-radio-amateur-moderated-request@panix.com.

```

I am thinking of making a new antenna but in the info it talks about, if the SWR is high on the low part of the band.

In the 20 meter band are they referring to 14.000Mhz end or the 14.350Mhz end of the band as being the low part of the band?

Any help please.

Thank you

The question was: "Does solid insulation makes the radiation weaker or stop
it?"

Instead the answer you serve me the word salad.

it will not stop it, it might make it stronger or weaker depending on
the loss characteristics and what you measure as the strength.

When talking about the swr and low end of the band, that is the lower frequency part of the band. In your example it would be the frequencies near 14.000. Frequencies near 14.350 would be the upper or high end of the band.

It can be confusing as when you hear 'top band' referred to that is usually the 160 meter ham band. Guess that it got that way because the 160 meter is the highest ham band in meters even though it is the lowest in frequency.

What is really confusing is what is meant by a statement like: "This
antenna only works well above 40m."

It literally means that the antenna only works well at frequencies
below 300/40 =3D 7.5 MHz, but that is not what most hams mean when they
say it.

And what with the "natural" insulations: the ice and the wet?

Sometimes are on your dipoles an ice or water.
They should melt/evaporate in the places where are picks of the voltage.
Is it observed?

Lodge observed the glows. So there should be the heating also.
Burn off an insulation needs more heat than melting/evaporating of
ice/water.

And the question has been answered many times now by several people.

In the real and practical world, no, insulation will not stop the radiation from an RF antenna and depending on the frequency and material of the insulation some of the radiation will be aborbed as heat by the insulation.

The was the additional question: "And what with the "natural" insulations:
the ice and the wet?

Sometimes are on your dipoles an ice or water.
They should melt/evaporate in the places where are picks of the voltage.
Is it observed?

No ice and rain in your area?

What part of the words "insulation" and "insulator" do you not understand?

There is nothing special about ice or liquid water and the electrical
properties of both can be easily looked up.

There is nothing mystical about something that is "natural".

<snip remaining babble>

You assume that everything "can be easily looked up". It is right for the old theories.

But now is the new Art's "time dependent Gauss law" theory.

At the ends of the dipole the alternate electric field is produced. There is the Lodges glow.

So it is interesting if that glow is also visible on insulated wires and
what is emitted from the antenna.

You have opportunity to develop the Art's theory. Do not be lazy.

i suggest you talk to art about art's theory, the rest of us on here
know that it is pure garbage. for your information gauss's law has
always been time dependent, art just doesn't understand that and
insists on rewriting and reinterpreting it. he is wrong, and you are
wasting time trying to follow him... but then again you are wasting
your time on just about everything you write on here anyway.

I'm not sure you've hit it here.  Mr B seems to understand language, he
just ignores the responses if they don't support his skewed world view.

Possibly this is an undiscovered binary version of aphasia.

You're missing something very important here, and you ask for the
information and then discount it when it doesn't satisfy you.

The MEASURED CHARACTERISTICS of something cannot change just because the
theory explaining it has changed.

And it is quite easy to find.  I'm surprised since you seem to be able
to find all the esoteric explanations of how the world works.

Your brain is broken, get it checked.

I would like to know if I can use RG-6 75 ohm coaxil TV cable to feed a
14 Mhz dipole with 100 watts PEP.

Thank you very much.

Yes you can.

Some RG-6 cable has an aluminum shield and can not be soldered to if that is a problem for you.

In June, we had a long discussion of RG-6 coax, the proper connectors to use for it, and how well it works.

To recap, you need to buy COMPRESSION connectors and the correct tools for them. "F" connectors are used all over the world in the cable tv and satellite industry. F to UHF (aka PL-259) adaptors are available and work well.

In my case, I have a cheap source of BNC to to UHF adaptors, F to UHF adaptors are hard to find and expensive. So I use compression BNC connectors for those ends.

Geoff.

Longitudinal electric waves were supported by all scientists.
Maxwell-Heaviside's erroneous hipothesis is chosen to teach the field
theory.
Radio people should know that.

Yes. But the permittivity is the result of the conductivity measurement.
Conductors, semiconductors and insulators are for students. It is
simplification.
The reality is more complex.
>

I can find milions papers on the theory of glow and losses in AC network.
The same should be for the radio frequences.
I was thinking that somebody from you have a link to such.

The AC glow is not simmetrical. So in the radio transmitter must be the
netto electrons flow.
Where can I find the DC ground current?

Are you assuming that because there is high voltage, there is current
induced heating?
```

Voltage does not translate diresctly to heat.

```

When is everyone going to wake up. What we need is a USB dongle which
is simply a recvr/xmitter and is software driven. This is the last
"cell phone" you will ever need to purchase. It can incorporate an
onboard antenna, however should also have an external ant connection so
in fringe areas communication is improved.

Isn't it about time we stopped buy a seperate TV, radio, phone, stereo,
etc. A computer with the proper software and attachment(s) are all of
these and more.

It is time to end the stone age of electronics!

Regards,
JS

Bill Miller calls it "the transverse current". Electrons must displace
perpendicular to the antenna surface in AC.
In insulators are the electric losses.
>
> Voltage does not translate diresctly to heat.

In insulated antena are the transverse current and the displacement current.

The all are facts. Should be easy to observe.

Some topics ago somebody analised the antenna temperature.
The end of the dipole should be the hottest.

Have you any observations in this subject?

Hello Alejandro:

If you can solve the mechanical issues, yes you can.

When it has an electrical length n*0.5lambda (n= 0, 1, 2, etc), VSWR will be exactly the same as with a 50 Ohms cable. With other length (especially 0.25, 0.75 lambda, etc) length, you may get change in VSWR (can be both better or worse).

When your dipole is about 50 Ohms (antenna side), just match it at the transceiver side if required, and don't worry about the cable loss due to VSWR inside the cable. When the antenna itself shows VSWR=1 (based on 50 Ohms), your VSWR at the transceiver side should not be worse then 2.25.

You can use same common mode current suppression techniques (balun, ferrite common mode chokes, trap, etc) as with a 50 Ohms cable.

Best regards,

Wim

Is a quantum effect current flow, and does heat emit from the process?
If it isn't heat induced, the effect is almost certainly ionization.

Aside from analysis, has anyone measured this effect?

Is it to be expected in highly efficent antennas, or just inneficient
ones in which there is substantial heating already?

Is this assuming that the heat if given off is enough to raise the
temperature surrounding th eantenna above 0deg C?

No it isn't. I don't want to take calls on my television. The XYL will
talk for hours with friends. Seems like a bad thing to tie the TV up for
that time. I don't want my telephone to be my computer either, or listen
to my music on my telephone.

It's for the same reason that I don't want to keep my frozen meat in my
car. A whole lot of us prefer our devices to be purpose built instead of
the myriad of compromises in having all in one instruments. History has
shown that all in one devices tend to perform poorly or mediocre at best
in all their functions.

They kind of remind me of the Escalade SUV/Pickup trucks. Horrible
pickup truck, poor SUV, and ugly as sin.

> It is time to end the stone age of electronics!

I want faster, better looking, and higher performance. I don't want
all-in wonders, which are always compromises.

Only a damn fool would make a phone call on their TV, or even think about it. But, if the case is you and the wife can't afford seperate hand-helds/netbooks, well, get a better job!

> It's for the same reason that I don't want to keep my frozen meat in my

Again, only a damn fool would think about keeping food in their palm-top/ereader/netbook, or even think about it. Hmmm, my computer is not a printer, but an external printer hooked up workes just fine. My computer is not a netcard, but a USB dongle netcard works just fine--plugged in, my computer is not a TV, but an USB dongle HD TV works fine--plugged in, etc. In fact, I have never noticed any problems with them running all at once. Perhaps you need new hardware.

> They kind of remind me of the Escalade SUV/Pickup trucks. Horrible

Never seen wheels, steering wheel, gearshift, headlights, etc. on a palm-top/ereader/netbook/laptop/computer. This sounds more of mental condition and/or drugs.

Must be boring never using any USB or ported peripherals, as your post indicates! Try it, you will find that "all-in-one-wonders" are great!

I also plan to use the 75 ohm cable to feed a vertical for 20 meters 32�
high, that is to say aprox. 22 feet.

With that high, the impedance is 100 + i145 ohms. The reactance is
inductive and I will tune it out with a 80 pf capacitor in series made
with the same cable.

The feed line will be 1 +1/4 lambda so at the input of the line the
impedance will be (75 x75)/108 = 52 ohms
```

The 8 radials will be 4 feet long with loses of aprox 5 ohms, so
efficiency will be near 94%.

Problem with all that is the dipole may be closer to 70 ohms than it is to
50 ohms. With 70 ohm cable, the swr will be close to 1:1. However most swr
and wattmeters that I have seen are for 50 ohm systems and will not show the
actual swr.
Cable losses with an swr of less than say 2:1 will be low enough not to make
any differance in the real world.

Dremels are great for this, but if you use it, get the coated fiberglass cutoff wheel. The other will shatter if the whip shakes at all.

But even simpler... Just file a notch on the whip on either side with a small file. Once you have a notch, use two pairs of vice grips to grab either side of the notch and it should snap easily. Or use a vice and pliers. The trick is to grap the whip as close to the notch as possible and bend quickly. Then file to clean up the break.

With the notch methond, you can snap 1/8" 17-7 stainless fairly easily. You won't snap big stuff, like 1/4" whips, but you're not likely to run into them.

17-7 is common for whips, and by now you've probably discovered how tough it is, and how quickly it ruins cutters and nips!

> the AC resistance goes more as the diameter than as the cross
> sectional area (hollow tubes work just as well as solid conductors).

The problem is that while we might characterise the raw excitation caused by lightning, and use assumptions about the shape, rise and fall times and peak field strength, the response of circuits (such as those that include the down conductor) is quite different, and it is unsafe to assume in the general case that skin effect is fully effective for all or even most of the energy spectrum.

Perhaps that is why some of these standards tend to treat the conductor as having a resistance equal to that implied by just the conductivity (or resistivity) and CSA. It might be conservative, but then standards tend to be so.

Having seen the results of fairly detailed EM modelling of EMP and lightning excitation of major infrastructure, and the effects of some small changes to the model, I wonder a bit about the effectiveness of some measures... but over engineering probably saves the day in a lot of cases.

The real danger with lightning protection is that a half baked approach my give the implementor some comfort, but actually increase the risk of adverse outcome.

The most thorough and consistent practice I have seen is that employed here in mobile phone base stations. Sure, they are occasionally damaged by lightning, but the vast majority of lightning incidents do not cause permanent damage.

Owen

The biggest problem with lightning protection in my area is that the local power company leaves the ground lines coiled up at the bottom of the poles. On about half the poles I've checked.

When they put the new transformer in across the street from my house the crew said they would be back to put in the ground rod. Nope. So I called a friend that si a troubleshooter for the power company about 2 months later and told him about it. "Yup, I'll get somebody right over." No joy 4 years later.

I lost $1500 dollars worth of gear last year because the only decent ground was connected to my radio. And every bit of current that came into the house on the power line exited that direction.

The power companies are likely the worst culprits from my perspective. I have installed more grounds at my house than the rest of the street has. Probably not all to spec, but safer than what wasn't here before.

I also discovered the dictionary definition of replacement cost is not the same one the insurance industry uses. Big surprise.

I think I'd rather have the one in the clear. What you can do is use shorter radials in the directions with less room along with the longer ones in the better directions. Most of the ground loss with a monopole is at the immediate base of the radiator. So the shorter radials should help more than one might think. But I think it would be worth it to get away from the wire laden buildings.

Actually, I would prefer to elevate the antenna on a mast, but I don't know if that is an option.

Elevating gives a much better line of sight, but also greatly reduces the number of radials needed to reduce ground loss.

If the vertical is high enough in wavelength, one radial is all you really need for an efficient antenna. Two is the minimum number needed to have a good omnidirectional pattern if you run them out ground plane style 180 degrees apart.

One with a single radial acts more like a dipole than a vertical.

If the radial can drop down, you have a half wave vertical with an omnidirectional pattern, but most will be using metal masts to support the elevated vertical, and will have to fan it out ground plane style. And that will skew the pattern a tad, but not hugely so.

Of course, if you elevated a HF6V, you would need at least one tuned radial for each band to use it on all bands.

A 4" grinder works fine, but is really over kill.
A Dremel tool is just dandy, cut and round the end easily.
In the field, use a set of linemen pliers.
Put the antenna in the cutting portion, hit the top of the pliers on the
flat surface with a hammer.
Do it smartly and the cut is neat and clean.

As usual, I cannot recall the source, but I read somewhere that the symmetry and general layout of the radial field (buried radials) has little effect on the radiation pattern. I do recall that I considered the source credible.

I think there is a release of the NEC engine that supports ground models but I don't know if that will answer this question. Unfortunately it is priced beyond this hobbyist's budget.

There may be more than two choices. Don't overlook placing the antenna between these two extremes.

Hello,

I bought a MFJ1622 antenna at a flee market, but it lacks some parts : wip and wiring.
I have replaced the wip by a TR-PP-13 collapsible (military antenna) but I don't have any idea of how was the original wiring of this antenna.
I tried several kind of wiring and they work , rather well, but I would like to know and use the original wiring...

Could someone explain to me, how it is made ?

Thanks a lot.

SC

OK Bert, thanks a lot for your answer.

I have already found that manual, but it don't explain the wiring with a schema.

I had found this link :   http://www.pbase.com/vr2ham/image/84202109
But I wonder whether it is the good manner, to connect the coax at the bottom of the coil , because I'm afraid that the wire between the alligator clip and the bottom of the coil makes a short circuit which could decrease the quality of the active part of the coil.
I wonder whether the original wiring, wouldn't be not isolated from the bottom of the coil...
Another idea would be that the wiring would be the same that the wiring of the "miracle antenna" which ran nicely at my last tests ?

Minnesota is very similar to Illinois, and seems to be about as corrupt in the way that only long entrenched Democrat machines can be. They're just much nicer and friendlier about it. Which is a great disguise in most cases, and helps the news crews put a positive spin on all the nonsense that happens here.

I think I'll forego the pleasure of dealing with any state level bureaucracies, thanks.

But thanks for the advice, I do appreciate it.

tom

Hello Giovanni,

My first impression is for 80m go for the good ground site and for the
upper bands go for the clear area. From a man made noise perspective,
I would go for the clear area, but of course this one you can check
via S/N ratio of received stations. The clear area may result in less
interference from your signal in user equipment.

Regarding the buildings, are they very large in horizontal size and
height or do I have to think of just three isolated buildings without

any other buildings behind it (seen from the antenna)? If there were many buildings, I would go for the clear area in both cases.

Regarding radiation pattern, I would not worry about this. If you can put the antenna such that you have most of the long radials in two opposite direction only, the effect on radiation pattern is negligible.

For the DX case, you will rely on the vertical component only as the horizontal component will vanish more rapidly under decreasing elevation angle. Your radiation pattern (elevation pattern under varying azimuth) depends heavily on ground properties several wavelengths away from the antenna and you have no influence on that.

Best regards,

Wim

Simple hack to get $2000 to your home  At http://1023setvideos.co.cc

Due to high security risks, i have hidden the cheque link in an
image.  in that website on Top side Above search box, click on image
and enter your name and address where you want to receive your
cheque. please don,t tell to anyone.

come on, we can't let this group be taken over by just the spammers!
ART!  you must have an opinion on this, why aren't they using your
gaussian design to get their magic levitating neutrinos to fly off
their antenna??? or is their antenna not diamagnetic so it suffers
from a shortage of neutrinos??

Each cloud has a charge and the all is flowing to the ground. But only 20%
as the direct stroke.

The rule is simple. A mast with the polished ball on the tip attract the
direct stroke (polished ball do not dissipate).
A mast with many sharp spikes dissipate the static charge and eliminate the
direct strike.

> Direct strikes are typically around 20 kA, and can be as high as 100kA.

It is the oscillating current which has a canal in the air. It is not
obliged to flow only in the wire.

wrong, sharp spikes are designed to start an upward streamer that
connects the downward leader to the lightning rod.  that is why they
have a sharp point, to reach the breakdown field gradient before
anything else around them.

normally they don't oscillate, it is a mono-polarity pulse.

A mast with a ball is less likely to attract a strike. That is why
they are
used on flag poles, etc.. They don't stream near as well as a sharp
point. They can still be struck though if nothing more attractive
is around as far as streamers.
A pointed mast streams much easier and will be much more
effective as a lightning rod.
A mast with a lot of spikes is wishful thinking. You can not bleed
off the charge fast enough to eliminate strikes. It's like whizzing
in a whirlwind.
You can not eliminate a direct strike by bleeding off the charge.
You can only offer it a better and easier streaming target than
whatever you do not want struck. And the sharper and more
pointy an object, the better it streams. When is the last time
you saw a lightning rod with a polished ball on top?
They don't sell them, as they would be fairly useless.

Thanks to all for the good advice. You all agree that the priority is to have the antenna on the clear.

To summarize , I would exclude the option to elevate the antenna because I do not like to walk on roofs or climb towers any more, a ground level antenna is much more safe.

About the ground radials, my understanding is that the RF current flowing in to the antenna from one terminal of the feed line, must return to the second terminal of the feed line that is grounded at the antenna base, and it will do so flowing through the soil in the vicinity of the antenna. If I provide a more conductive path on the soil by laying radials, the electrons will find it, regardless of the simmetry of the system and avoid to dissipate energy heating up the ground.

On the other hand, a building near the antenna is not connected to the second terminal of my feed line and so the RF current captured by the building metallic structures can only be dissipated and playing funny games with the electronics gadgets inside the building.

Now that I decided to put up a new antenna, let's just hope the solar cycle 24 will behave.

Thanks to all
Giovanni

Actually, air terminals with blunt ends and sphere ends have been tested by Erico, and they work about the same as the traditional "Franklin" style with the pointy end.

> They don't sell them, as they would be fairly useless.

That's not because they work or don't work, it's because fashion dictates pointy end. You'd have to have a substantial performance improvement to justify something different (i.e. to be unfashionable, it had better give you something else).

At the fields in play here, whether you have a 1/10" radius or a 1/2" radius or 3" radius, it doesn't make much difference.

the breakdown voltage for a curved surface is roughly 3MV/meter or 70kV/inch.

So a 1/2" diameter rod (1/4" radius at largest) will breakdown at about 17-18 kV.   A 6" diameter ball breaks down at 200kV or so (assuming it's perfectly smooth, etc.)

The "free air" electric field without a storm around is on the order of 100 V/meter, rising to 10-20 kv/m under a storm. So, get 10-15 meters up, and you've got your 200kV needed to start corona on even a pretty big diameter thing.

If the ball is wet, especially with distinct droplets, then you can get corona forming much earlier. The electrostatic forces tend to make the droplets fly off.

Non-rhetorical question(s).

I must be missing something then. Why don't I see corona on the tips of leaves at the tops of my trees? Trees are pretty conductive when hundreds of kilovolts are involved.

Or my antenna masts for that matter, 'cause they are grounded, too.

Normally in ALL sparks current oscillates: " The storm detector is a radio
receiver .
"The device was invented in 1894 by Alexander Stepanovich Popov. It also was
the first radio receiver in the world.
Ground-based and mobile detectors calculate the direction and severity of
lightning from the current location using radio direction-finding techniques
together with an analysis of the characteristic frequencies emitted by
lightning"

You have missed that: "Physically, St. Elmo's fire is a bright blue or violet glow, appearing like fire in some circumstances, from tall, sharply pointed structures such as lightning rods, masts, spires and chimneys, and on aircraft wings. St. Elmo's fire can also appear on leaves, grass, and

even at the tips of cattle horns.[3] Often accompanying the glow is a
distinct hissing or buzzing sound."

> Or my antenna masts for that matter, 'cause they are grounded, too.

Your ground wire is broken. Check it.

>A mast with a ball is less likely to attract a strike. That is why
they are
used on flag poles, etc.. They don't stream near as well as a sharp
point. They can still be struck though if nothing more attractive
is around as far as streamers.
>A pointed mast streams much easier and will be much more
effective as a lightning rod.
>A mast with a lot of spikes is wishful thinking. You can not bleed
off the charge fast enough to eliminate strikes. It's like whizzing
in a whirlwind.

For Franklin it was obvious: "This grew into his idea for the lightning rod.
Franklin described an iron rod about 8 or 10 feet long that was sharpened to
a point at the end. He wrote, "the electrical fire would, I think, be drawn
out of a cloud silently, before it could come near enough to strike..."
From: http://www.fi.edu/pieces/hongell/

>You can not eliminate a direct strike by bleeding off the charge.
>You can only offer it a better and easier streaming target than
whatever you do not want struck. And the sharper and more
pointy an object, the better it streams. When is the last time
you saw a lightning rod with a polished ball on top?
>They don't sell them, as they would be fairly useless.

But somebody want to catch strong lightnings:
"Blunt-tipped lightning rods are intended to intercept rather than to
prevent lightning strikes. They are intentionally located at the point of
maximum dielectric stress. (See Figure 2). " From:
http://www.nottltd.com/article.html

you like quoting stuff off the web don't you... too bad you don't
understand the basic physics behind it. no, the spark current doesn't
have to oscillate to be picked up by a radio receiver. The short
pulse, yes even one that doesn't oscillate itself, is made up of a
large number of sine waves added together, it is those that can be
picked up by radio receivers. it is also possible at a large distance
to determine the polarity of the lightning stroke as they can be
either positive or negative strokes, that type of distinction wouldn't
be needed if they oscillated.

Electrons like oscillate. The natural oscillations go up  and next decay.
Each next jump is stronger at the beginning and weaker at the end.

Lightning jumps from the higher voltage area to the lower. It means that
netto electrons flow always from cloud to earth. But before such are many
lightnings cloud to cloud. Sometimes (5%) are cloud-earth-cloud.

In the all cases the current oscillate.

Yes. I mix the oscillating with pulsating: "Years later, Lodge realized that lightning is not an oscillatory discharge but is actually a rapidly pulsating unidirectional (dc) discharge.[2] However, the effects of the inductive reactance on the flow of these pulsating lightning currents is the same as Lodge predicted for oscillatory currents" From:

Have you ever seen the glow: "In addition, the scientist was able to
demonstrate that standing waves existed along the wires. In a darkened room,
he observed a visible glow along the wires at one-half wavelength intervals
corresponding to the voltage peaks. He also performed a number of other
experiments concerning the characteristics of discharging Leyden jars during
that spring and summer of 1888."

In Art's equilibrium and Michael's "truds" are more sense than in yours
"magnetic whirls".
All radio history apply to the longitudinal electric waves (Tesla waves) in
wires and in the space.

Lodge made the long wire antennas (see Fig 2):
http://www.antiquewireless.org/otb/lodge1102.htm

The sparks are rather harmfull for transmitting. The better is a field
emission of electrons ("truds" or the "time dependent Gauss law").

You are an expert.
Does antenna radiate if it is coated with the thick good insulation?

Unfortunatly the coherer do not work nowdays. To much electric waves in the rare plasma.

But the Lodge's "electrical radiation" ("time dependent Gauss Law") works.
"Lodge then added a postscript to his own paper acknowledging Hertz's work in an extremely positive way. He concluded the postscript by saying: "The whole subject of electrical radiation seems working itself out splendidly".

In the clear air field (the 100V/meter sort of thing), you're not going to see corona, because the voltages aren't high enough.

In thunderstorm type fields, you would see corona, if you look closely. There's an interesting paper (which I can't find right now, but I'll look) where someone measured the current from a field of wheat.

Not all breakdown will produce visible corona.

If you have a resistive thing (i.e. a tree), covered with sharp points, then the object tends to adopt the overall voltage profile surrounding it, so there's not much net difference in voltage between the leaf/needle and the surrounding, so the field isn't locally high, so there isn't any breakdown.

>
> Or my antenna masts for that matter, 'cause they are grounded, too.

You probably DO have corona breakdown, it's just not noticeable. It's kind of a challenge to measure microamp currents in a 100 foot tower. And if that milliamp or microamp is spread over a large area (i.e. your tower isn't a smooth machined surface with only the one point having small radius of curvature) then it would be less noticeable.

St. Elmo's fire and corona discharge are distinctly different, although

St. Elmo's is often described as corona, it actually isn't.

Yes, corona in high fields does sound like hissing or buzzing. Anyone who has been on a high mountain in a thunderstorm has probably experienced this, and even more exciting is when you get corona discharge off your hair standing on end.

St Elmo's is a bit different. It has a distinctly different appearance: a sort of bluish glow that extends some distance surrounding the object, as opposed to corona, which seems to be "stuck" to the surface. And then a high field streamer discharge is still different. If you've seen both, it's noticeably different, but hard to describe.

As best can be determined, St Elmo's arises when the surface of an object is wet and in a field. The water sprays off the surface (much like is done in electrospraying), and the droplets carry charge away. Several different things then happen: 1) The charge causes the droplet to break apart into smaller droplets from electrostatic forces; 2) the field at the surface of the droplet is now too high and the air breaksdown at the surface of the droplet, discharging it, and 3) the droplet starts to shrink from evaporation, getting smaller, so the field at the surface grows, etc.

So St. Elmos is not really corona off the object, but corona/breakdown on the droplets being electrosprayed off the surface.

It is possible to generate St. Elmo's in the lab on the surface of an object with fairly large radius of curvature (i.e. that would NOT be subject to surface corona) in a moderate field. If someone wants to try an experiment, put a wet cork or dowel of wood in a shallow tray or puddle of water with a large flat electrode suspended over it to create the overall field. A field of 10kV/cm will work quite nicely. I used two baking pans separated by cut down styrofoam cups driven by a small modular HV supply (50kV@ a few mA) driven by a variac. Make sure you have a resistor in series with your HV supply, because occasionally you'll get a flashover, and you want to limit the current.

For what?

Insulated antennas work just fine.

Does the velocity factor of the coax come into play when locating the
second
choke or does the outer shield behave like an open wire, VF ~ 1.0?

Perhaps I am slicing the baloney too thin for an average sandwich ;-)

You will often see emphatic advice as to which side of the thing to attach the shield, and which the centre conductor.

In fact, the antenna structure lends itself to an effective integral balun. If you take the feed coax through the bottom wall of the U section, bonding the shield to the tube, and up one side (doesn't matter), exiting at the appropriate point. At this exit, trim the shield and bond it to the tube, and take the inner horizontally across to the other tube and connect it.

If physical symmetry is very good, the balun will be very good.

Nevertheless, as Roy observes, the feedline and supporting structure below the U section is coupled and there is still potential for some level of common mode current.

(To preempt Roy, the velocity factor of the outside surface of the shield clad with a thin layer of vinyl will be close to 1, close enough for the purpose at hand.)

Owen

The news have it:
 Apple's new I phone cuts connections frequently due to bad reception.
That happenes when holding the I-phone in a certain way.

http://tinyurl.com/32lp96x

cit:

 (01.07.2010)

Antenna engineers, Apple wants you to help with iPhone reception
Are you an unemployed antenna engineer who specializes in wireless mobile devices?
Are you an unemployed antenna engineer who specializes in wireless mobile devices? Apple Inc. might have a job for you. The company, which is under fire for reception problems with its newest iPhone model and its iPad tablet computer, has posted three openings on its website for jobs described as "Antenna Engineer-iPad/iPhone." � Don't miss a thing. Get breaking news alerts delivered to your inbox. The

posts are dated June 23, the day before the launch of the iPhone 4, which customers have been complaining loses signal when held in certain ways that seem to interfere with the device's antenna. Apple responded to complaints last week in a statement that said some loss of reception is common when gripping any wireless device. The Cupertino, Calif.-based company suggested users avoid gripping the phone "in the lower left corner in a way that covers both sides of the black strip in the metal band." Or, the statement suggested, owners of the phone could purchase one of several cases being marketed for the device. One iPhone 4 user who e-mailed Apple Chief Executive Steve Jobs directly about the issue got a response that said, in entirety, "There are no reception issues. Stay tuned," according to the popular MacRumors website. Analysts at ISuppli Corp. said similar issues weren't that common among other smart phones because the antenna is usually packed inside. The iPhone 4's antenna is a steel frame that wraps around the device to boost cellular coverage, Jobs said at the phone's unveiling June 7 in San Francisco. The Apple job description says candidates "should be able to design antennas suitable for wireless handheld devices with excellent radiation performance." The company did not return phone calls or e-mails on Wednesday requesting comment on the ads. Despite complaints about iPhone 4 reception that popped up widely on the Internet soon after the phone was released, Apple sold 1.7 million of them -- a record for the company -- in the first three days the device was on the market. The iPhone 4 starts at $199 with a commitment to a two-year AT&T cellphone plan. Apple says it expects to be selling the phone in 88 countries by September

end cit.

Other sources mention a 100 mio dollar research budget
to fix that Ipod antenna.

Ever heard about diversity antennas, 3dB coupling of
antennas using directional couplers, switchable antenna arrays?

100 mio dollars are out there waiting for you!

w.

It's not that bad a joke.. If the ground connection is good, #10
is plenty thick enough. In fact, it would barely get warm if it
took a strike. Of course, if the connection to ground is bad,
it will be toast. But so would a lot of heavier gauges also..
The connection to ground is the critical factor in such a case.
But I would still follow what the local code says.
The main reason I'm making this post is only to clarify that
under proper conditions, #10 is plenty thick enough to safely
route the strike to ground with no damage to the wire.

... and take *real* care to waterproof the point at which the cable exits from the tube and the shield is bonded! Buy a tube of non-acid-containing (metal-safe, "neutral cure") silicone sealant, and apply it very thoroughly here... squeeze and press plenty of it into the braid and then form a layer which completely seals the exit point.

If you don't do this, and leave even a small amount of braid exposed to the air, it will tend to "wick up" moisture into the braid every time it rains.. The water can even wick its way down to the bottom of the cable and you can find water dripping out of (or filling up) the connector at the bottom! Trust me, it really does happen... I found my lower N connector full of water, and what I swear appeared to be algae!

I've been watching this unfold over the last week or so and I think
Apple has hit the point where you can't have your cake and eat it too.
New gadgets are fine, but there is a limit on cell phone reception.
It isn't magic but people tend to think it is. I have cell phones all
over the place since my wife is a cell phone addict where I could care
less. There are dead zones depending on who you have signed up with. I
found this painfully true when I was on a bicycle ride in the mountains
and two women were talking with a tower in plain sight. My phone would
not connect since it was a propriety kind of thing. I think you can dial
911 and force a connection, but that is about it.
Bill Baka

I'll second that ! Having seen TV's and set top boxes damaged by
ingress of water.

I need to "trim" the steel whip of a two meter antenna, and have not been sucessful in finding an easy way to cut. Tried a vise-grip with its close-in pinchers, and also tried a heavy duty pair of wire cutters, but no go.

What common tool can be used to do this ?   This steel whip sure is tough
!!

Thanks !!

I use a small rotary grinder to cut a line around the whip and snap it apart in a vice.
